LINEARIZATION OF GEVREY FLOWS ON $\mathbb{T}^d$ WITH A BRJUNO TYPE ARITHMETICAL CONDITION

JOÃO LOPES DIAS AND JOSÉ PEDRO GAIVÃO

Abstract. We show that in the Gevrey topology, a $d$-torus flow close enough to linear with a unique rotation vector $\omega$ is linearizable as long as $\omega$ satisfies a novel Brjuno type diophantine condition. The proof is based on the fast convergence under renormalization of the associated Gevrey vector field. It requires a multidimensional continued fractions expansion of $\omega$, and the corresponding characterization of the Brjuno type vectors. This demonstrates that renormalization methods deal very naturally with Gevrey regularity expressed in the decay of Fourier coefficients. In particular, they provide new linearization results including frequencies beyond diophantine in non-analytic topologies.

1. Introduction

The study of quasiperiodic motion yields a remarkable problem where dynamics, number theory and functional analysis meet intrinsically. It consists on the straightening of orbits, hoping that there are invariant sets which are essentially minimal translations with zero Lyapunov exponents. It turns out that the existence and regularity of the corresponding coordinate change depends deeply on the arithmetical properties of the motion frequency. This phenomenon relies on the subtle control of Fourier modes which are resonant with respect to the frequency, the so-called small divisors.

Flows on the torus provide one of the simplest but fundamental examples where to tackle small divisors problems. The same ideas can be extended to more elaborated systems such as the Hamiltonian ones. The dimension plays also an important role in the type of results that can be obtained. Indeed, the Poincaré transversal map of the equilibria-free two dimensional torus flow consists in a circle diffeomorphism whose theory was largely developed by Arnold [1], Herman [9] and Yoccoz [33, 34] in the real-analytic, smooth and finite regularity classes. On the other hand, in higher dimensions many questions remain unanswered besides the case of small perturbations around linear dynamics. Those questions include the optimality of the frequency conditions and non-perturbative results.

In this work we study vector fields on the \( d \)-torus \( \mathbb{T}^d = \mathbb{R}^d / \mathbb{Z}^d \), \( d \geq 2 \), having Gevrey regularity. Functions with \( s \)-Gevrey regularity are, in a sense, an interpolation between real-analytic \((s = 1)\) and smooth \((s = \infty)\) ones. Their decay of Fourier coefficients behaves like \( e^{-\rho |k|^{1/s}} \) where \( \rho > 0 \). For \( s = 1 \) this is the decay for analytic functions on a complex strip of width \( \rho \).

The conjugacy class of a constant vector field \( \omega \) depends on the arithmetical properties of \( \omega \) and on the considered topology. It is well-known that for real-analytic vector fields, if \( \omega \) satisfies a Brjuno diophantine condition, the topological and real-analytic conjugacy classes coincide in some neighbourhood of \( \omega \) (cf. [28]). This property is known as rigidity, in the sense that the topology implies the geometry of the system. Here we introduce a novel Brjuno type diophantine condition on \( \omega \) and show that local rigidity also holds for Gevrey vector fields.

More precisely, an \( s \)-Brjuno vector is defined to be any \( \omega \in \mathbb{R}^d \) such that

\[
\sum_{n \geq 0} \frac{1}{2^n n^{1/s}} \max_{0 < \|k\| \leq 2^n, k \in \mathbb{Z}^d} \log \frac{1}{|k \cdot \omega|} < \infty.
\]

In section 3 we present the characterization of \( s \)-Brjuno vectors using multidimensional continued fractions. Notice that the classical Brjuno condition is given by \( s = 1 \).

**Theorem 1.1.** Let \( s' > s \geq 1 \). If an \( s \)-Gevrey flow on \( \mathbb{T}^d \) has a unique rotation \( s' \)-Brjuno vector \( \omega \) and it is \( s \)-Gevrey-close enough to linear, then it is \( s \)-Gevrey-conjugate to the torus translation \( x \mapsto x + \omega t \mod \mathbb{Z}^d \), \( t \geq 0 \).

This theorem shows that the diophantine condition is not optimal for Gevrey vector fields as in the smooth case, since the new class of rotation vectors strictly contains all diophantines. Notice that if a vector field is topologically conjugate to \( \omega \), then its rotation vector is unique and equal to \( \omega \). Therefore, local rigidity follows from the above theorem.

We show Theorem 1.1 using a renormalization method, taking advantage of the multidimensional continued fraction expansion of a vector in the spirit of Lagarias [18] and Cheung [7] (cf. [8]). The renormalization acts on the space of Gevrey vector fields and convergence to a trivial limit set implies conjugacy to a constant vector. Requiring a sufficiently fast convergence rate restricts the class of frequencies, thus determining the \( s \)-Brjuno condition \( \omega \).

The above theorem also holds for the related problems of existence of invariant tori in Hamiltonian systems near integrable on \( T^*\mathbb{T}^d \), including lower dimensional tori, and quasiperiodic linear skew-product flows on \( \mathbb{T}^d \times \text{SL}(d, \mathbb{R}) \). The proofs, to be detailed in a separate publication, are adaptations of the renormalization constructed in this work.
for Gevrey vector fields as is done in [10, 11, 16, 20, 14, 17] for the real-analytic class. Moreover, the equivalent results for the discrete time version of all these systems are also achievable using similar methods.

Carletti and Marmi [6] studied the Siegel center problem [29] of one-dimensional germs of diffeomorphisms for ultradifferentiable classes including Gevrey. In particular, they find that the Brjuno condition is sufficient to obtain linearization in this context. Other results on quasiperiodic systems in the Gevrey topology and Diophantine frequencies have only been obtained by analytic approximation techniques and using KAM methods [3, 25, 26, 30, 31, 32, 36], similarly to what is usually done for the finite differentiability case [35]. It is however a cumbersome strategy, with some obvious limitations when confronted with direct methods. As shown in this work, the renormalization approach is naturally constructed for the Gevrey case, giving new, simpler and stronger results as it is capable of dealing with some Liouville frequencies. Moreover, since the rescaling in the renormalization iteratively increases $\rho$, it avoids a common limitation while working with Gevrey and ultradifferentiable regularities related to estimates for the composition of functions (which have the effect of decreasing $\rho$).

The work of Koch [12] initiated a rigorous construction of renormalization operators on the space of real-analytic vector fields and Hamiltonian functions (cf. [23]). It was later improved by Khanin, Lopes Dias and Marklof [10, 11, 21] in order to deal with diophantine frequencies (see also [15]) by incorporating multidimensional continued fractions. Subsequently, Koch and Kocić [14, 15] used a renormalization method without the need of multidimensional continued fractions. They obtained related results for Brjuno frequencies in the context of more general real-analytic vector fields.

Renormalization consists on rescaling space and reparametrizing time. Zooming into a region in phase space requires an acceleration of the orbits in order to detect self-similarity, a fixed point (or other simple orbits) of the renormalization. Such fixed points are vector fields and can be trivial or critical. The former corresponds to the scope of KAM theory, namely the stability of persistence of invariant tori. The latter is related to invariant tori on the verge of breakup, i.e. at the boundary of the domain of attraction of the trivial points. Evidence of this is harder to obtain, and it is mostly through the help of computer-assisted methods (cf. [22, 13]).

Standard notations are included in section 2 and section 3 presents the multidimensional continued fractions scheme and the derivation of the set of $s$-Brjuno vectors. Section 4 is on $s$-Gevrey functions. Sections 5 and 6 define the renormalization operator, and section 7 includes the construction of the conjugacy for vector fields which are attracted under renormalization to the orbit of the constant system.
Note after revision: After the completion of this work we learned that Bounemoura and Féjoz found the same s-Brjuno arithmetical condition while extending the KAM theorem to Gevrey Hamiltonians [5] and to ultra-differentiable Hamiltonians [4].

2. Preliminaries

We set the notations $\mathbb{N} = \{1, 2, \ldots \}$ for the positive integers and $\mathbb{N}_0 = \mathbb{N} \cup \{0\}$ for the non-negative integers. The $\ell_1$-norm on $\mathbb{C}^d$ is denoted by

$$|v| := \sum_{i=1}^{d} |v_i|.$$  

The canonical inner product between vectors $u, v \in \mathbb{C}^d$ is given by

$$u \cdot v := \sum_{i} u_i v_i,$$

and it satisfies

$$|u \cdot v| \leq |u| |v|.$$  

Define the norm

$$\|v\|_* := \max\{\|\hat{v}\|, |v_d|\} \quad \text{and} \quad \|\hat{v}\| := \sum_{i=1}^{d-1} |v_i|,$$

where we use the notations $v = (\hat{v}, v_d) \in \mathbb{C}^d$ with

$$\hat{v} = (v_1, \ldots, v_{d-1}) \in \mathbb{C}^{d-1}.$$  

The above also defines the corresponding norm of a matrix $A = (a_{i,j})$ as the operator norm

$$|A| = \sup_{|v|=1} |Av| = \max_{j} \sum_{i} |a_{i,j}|.$$  

The transpose matrix of $A$ is denoted by $A^\top$ and its inverse (if it exists) is written as

$$A^{-\top} := (A^\top)^{-1}.$$  

In addition, $|A^\top| \leq d |A|$.

3. Multidimensional continued fractions

We introduce here a multidimensional continued fractions expansion of vectors in $\mathbb{R}^d$ and its main properties related to renormalization.
3.1. A special orbit on homogeneous spaces. Consider the homogeneous space $\Gamma \backslash G$ with $G = \text{SL}(d, \mathbb{R})$ and $\Gamma = \text{SL}(d, \mathbb{Z})$, the space of $d$-dimensional unimodular lattices. On its fundamental domain $\mathcal{F} \subset G$ consider the right action of the one-parameter subgroup
\[ E^t = \text{diag}(e^{-t}, \ldots, e^{-t}, e^{(d-1)t}) \in G \]
that generates the flow
\[ \Phi^t : \mathcal{F} \to \mathcal{F}, \quad M \mapsto \Gamma ME^t, \quad (3.1) \]
This flow is known to be ergodic [2]. In the following we will be interested in the properties of one particular orbit.

The size of the shortest non-zero vector in a lattice $M \in \mathcal{F}$ is given by
\[ \delta : \mathcal{F} \to \mathbb{R}^+, \quad \delta(M) = \inf_{k \in \mathbb{Z}^d \setminus \{0\}} \| k^\top M \|_\star. \quad (3.2) \]
Notice that $\delta(\Phi^t(M)) = \delta(ME^t)$ and that, due to Minkowski’s theorem, there is some universal constant $\delta_0 \geq 1$ depending only on $d$ and the norm such that
\[ \delta(M) \leq \delta_0, \quad M \in G. \]
In the following fix $\omega = (\alpha, 1) \in \mathbb{R}^d$. As we will see, the forward orbit $\Phi^t(M_0), t \geq 0$, of the matrix
\[ M_0 = \begin{pmatrix} I & \alpha \\ 0 & 1 \end{pmatrix} \quad (3.3) \]
will present us many arithmetical properties of the vector $\omega$. We have,
\[ \delta(\Phi^t(M_0)) = \inf_{k \in \mathbb{Z}^d \setminus \{0\}} \max \left\{ e^{-t}\| \hat{k} \|, e^{(d-1)t}|k \cdot \omega| \right\}. \]
Define the map
\[ W : \mathbb{R}^+_0 \to \mathbb{R}, \quad W(t) = \log \frac{1}{\delta(\Phi^t(M_0))}. \]
So, $W(0) = 0$ because $\delta(M_0) = 1$. In addition, $W(t) \geq -\log \delta_0$.

Notice that the function $W$ can be written as
\[ W(t) = \sup_{q \in \mathbb{N}} \sup_{\| \hat{k} \| = q} \Delta_k(t), \]
where we have the continuous piecewise functions for each $k$,
\[ \Delta_k(t) = \min \left\{ t - \log \| \hat{k} \|, -(d-1)t + \log \frac{1}{|k \cdot \omega|} \right\}. \quad (3.4) \]
The function $W$ is continuous since $\{\Delta_k\}_k$ is equicontinuous.

We observe that $\Delta_k(t) \leq t$ for any $t$. Indeed, the only case that is not immediate from (3.4) is $\Delta_{(0,k_d)}(t) = -(d-1)t - \log |k_d| \leq -(d-1)t \leq t$ because $k_d \neq 0$.

Moreover, we can write
\[ W(t) = \sup_{q \in \mathbb{N}} \sup_{\| \hat{k} \| = q} \Delta_k(t) = \sup_{q \in \mathbb{N}} \Delta_{p(q)}(t). \]
where \( p(q) \in \mathbb{Z}^d \setminus \{0\} \) is chosen such that
\[
\|p(q)\| = q \quad \text{and} \quad |p(q) \cdot \omega| = \min_{\|k\| = q} |k \cdot \omega|.
\]

We have
\[
\Delta_{p(q)}(t) = \begin{cases} 
  t - \log q, & 0 \leq t \leq T(q) \\
  -(d - 1)t + \log \frac{1}{|p(q) \cdot \omega|}, & t \geq T(q),
\end{cases}
\]
with
\[
T(q) = \frac{1}{d} \log \frac{q}{|p(q) \cdot \omega|}.
\]

Take the sequence \( q_0 = 1 \) and for \( n \in \mathbb{N} \)
\[
q_n = \inf \left\{ \|k\| > 0 : k \in \mathbb{Z}^d \setminus \{0\}, |k \cdot \omega| < |p(q_{n-1}) \cdot \omega| \right\}.
\]
Thus, \( W \) is a continuous piecewise affine function with slopes either equal to 1 or \(-(d - 1)\) given by
\[
W(t) = \Delta_{p_n}(t), \quad \tau_n \leq t \leq \tau_{n+1}
\]
where \( p_n = p(q_n) \) and
\[
\tau_n = \frac{1}{d} \log \frac{\|\hat{p}_n\|}{|p_n \cdot \omega|}.
\] (3.5)

The terms in the ordered sequence \( \tau_n \) of the local minimizers of \( W \),
\[
\tau_0 = 0 < \tau_1 < \tau_2 < \ldots,
\]
are called stopping times. Their number can be either finite or infinite. The local maximizers of \( W \) are
\[
T_n := T(q_n) = \frac{1}{d} \log \frac{\|\hat{p}_n\|}{|p_n \cdot \omega|}.
\]

Notice that
\[
W(\tau_n) = \tau_n - \log \|\hat{p}_n\| = \frac{1}{d} \log \frac{\|\hat{p}_n\|^{d-1}}{|p_n \cdot \omega|^{d-1}} (3.6)
\]
and
\[
\tau_{n+1} - W(\tau_{n+1}) = \tau_n - W(\tau_n) + d(\tau_{n+1} - T_n). \quad (3.7)
\]
In addition,
\[
W(t) = \begin{cases} 
  t - (\tau_n - W(\tau_n)), & \tau_n \leq t \leq T_n \\
  t - d(t - T_n) - (\tau_n - W(\tau_n)), & T_n < t \leq \tau_{n+1}.
\end{cases}
\] (3.8)

It is also simple to check that
\[
W(t) \leq t - \log(n + 1), \quad t \geq \tau_n
\]
for each \( n \geq 0 \) such that \( \tau_n \) exists.

**Lemma 3.1.** For any \( n \in \mathbb{N} \),
\[
\|\hat{p}_n\| \leq \frac{\delta_0^{d/(d-1)}}{|p_{n-1} \cdot \omega|^{1/(d-1)}}.
\]
Proof. Recall that $W(\tau_n) \geq -\log \delta_0$ and that the difference between consecutive minima and maxima of $W$ is given by

$$W(T_{n-1}) - W(T_{n-1}) = -(d-1)(\tau_n - T_{n-1}), \quad n \in \mathbb{N}.$$ 

Thus,

$$W(T_{n-1}) = T_{n-1} - \log \|\hat{p}_{n-1}\| \geq (d-1)(\tau_n - T_{n-1}) - \log \delta_0$$

and, by replacing the formulas of $\tau_n$ and $T_{n-1},$

$$\frac{d-1}{d} \log \|\hat{p}_n\| \leq \frac{1}{d} \log \frac{1}{|p_{n-1} \cdot \omega|} + \log \delta_0.

\Box$$

**Proposition 3.2 ([10]).** There exist $C_1, C_2 > 0$ such that for all $t \geq 0$

$$|\Phi^t(M_0)| \leq C_1 e^{(d-1)W(t)},$$

$$|\Phi^t(M_0)^{-1}| \leq C_2 e^{W(t)}.$$

**3.2. Classification of vectors.** Recall that $\omega \in \mathbb{R}^d$ is rationally independent (also called irrational) if $|k \cdot \omega| > 0$ for every $k \in \mathbb{Z}^d \setminus \{0\}$. Otherwise it is called rationally dependent. Moreover, $\omega$ is rationally independent iff $\{k \cdot \omega: k \in \mathbb{Z}^d\}$ is dense in $\mathbb{R}$.

**Proposition 3.3.** $\omega$ is rationally independent iff there are infinite stopping times $\tau_n \to +\infty$.

Proof. Assume that there is an integer vector $k \neq 0$ such that $k \cdot \omega = 0$. Then, $W(t) = \Delta_k(t) = t - \log \|\hat{k}\|$ for every $t \geq \log \|\hat{k}\|$, which eliminates the possibility of infinite local minimizers.

On the other hand, if there are only finite local minimizers, take the largest one $\tau_n$. Thus, for $t > \tau_n$ the function $W$ has to be increasing and thus equal to $t \mapsto t - \log \|\hat{k}\|$ for some integer vector $k$. That is only possible if $\log(1/|k \cdot \omega|) = +\infty.$

\Box

**Lemma 3.4.** If $\omega = (\alpha, 1) \in \mathbb{R}^d$ and $k \in \mathbb{Z}^d$, then

$$|\hat{k}|_d \leq |\alpha| |\hat{k}| + |k \cdot \omega|,$$

$$\|k\|_* \leq (|\alpha| + 1) |\hat{k}| + |k \cdot \omega|.$$

Proof. From the relation

$$|k \cdot \omega| = |\hat{k} \cdot \alpha + k_d| \geq |k_d| - |\hat{k} \cdot \alpha| \geq |k_d| - |\alpha| |\hat{k}|$$

we obtain the first claim. Finally,

$$\|k\|_* = \max\{|\hat{k}|, |k_d|\} \leq |\hat{k}| + |k_d| = |\hat{k}| + |k_d|.$$

\Box

Let $a \geq 1$ and the sets of integer vectors given by

$$K_a = \{k \in \mathbb{Z}^d: 0 < \|k\|_* \leq a\}$$

$$\hat{K}_a = \{k \in \mathbb{Z}^d: 0 < \|\hat{k}\| \leq a\}.$$
Lemma 3.5. If $\omega = (\alpha, 1) \in \mathbb{R}^d$, $a \geq 1$ and $b = \max\{a, (a + 1)|\alpha|\}$, then

$$\min_{K_a} |k \cdot \omega| \leq \min_{\hat{K}_a} |k \cdot \omega| \leq \min_{K_b} |k \cdot \omega|.$$ 

Proof. Since $K_a \subset \hat{K}_a$ the second inequality follows immediately. Now, notice that $\min_{\hat{K}_a} |k \cdot \omega| \leq |(1, 0, \ldots, 0) \cdot \omega| \leq |\alpha|$. Moreover, for any $k \in \hat{K}_a$, Lemma 3.4 implies that $|k_d| \leq (a + 1)|\alpha| \leq b$. As $\|\hat{k}\| \leq a \leq b$ we conclude that $\hat{K}_a \subset K_b$. $\square$

3.2.1. $s$-Brjuno vectors. For $s \geq 1$, a vector $\omega \in \mathbb{R}^d$ is $s$-Brjuno, i.e. $\omega \in BC(s)$, if

$$B_1(s) := \sum_{n \geq 0} \frac{1}{2^{n/s}} \max_{0 < \|k\| \leq 2^n} \log \frac{1}{|k \cdot \omega|} < \infty.$$ 

Notice that the convergence (and divergence) of $B_1$ is independent of the norm used. It follows that

$$BC(s) \subset BC(s') \quad \text{if} \quad s \geq s' \geq 1.$$ 

The case $s = 1$ corresponds to the well-known Brjuno contition. It is also clear that $\omega$ being $s$-Brjuno implies that all its coordinates are non-zero. Also, $\omega$ is $s$-Brjuno iff $c\omega$ is $s$-Brjuno with $c \neq 0$, and this class of vectors is $\text{SL}(d, \mathbb{Z})$-invariant.

Recall the sequence of vectors $p_n$ that correspond to the local minima of the function $W$ of a vector $\omega = (\alpha, 1)$.

Proposition 3.6. Let $\omega = (\alpha, 1)$ and $s \geq 1$. The following propositions are equivalent:

1. $\omega \in BC(s)$.
2. $B_2(s) := \sum_{n \geq 0} \frac{1}{\|p_n\|^s} \max_{0 < \|k\| \leq 2^n} \log \frac{1}{|p_n \cdot \omega|} < \infty$.
3. $B_3(s) := \sum_{n \geq 0} e^{-\frac{1}{s}(\tau_n - W(\tau_n))} \tau_n + 1 < \infty$.

Proof. By Lemma 3.5 we have that $B_1 < \infty$ iff

$$B_1' := \sum_{n \geq 0} \frac{1}{2^{n/s}} \max_{0 < \|k\| \leq 2^n} \log \frac{1}{|k \cdot \omega|} < \infty.$$ 

For each $n \in \mathbb{N}$ we can find $j_n \in \mathbb{N}$ such that

$$2^{j_n - 1} \leq \|p_n\| \leq 2^{j_n}.$$
Notice then that $j_0 = 1$ and
\[
\log \frac{1}{|p_n \cdot \omega|} = \max_{\|k\| = \|\hat{p}_n\|} \log \frac{1}{|k \cdot \omega|} \\
\leq \max_{0 < \|k\| \leq 2^n} \log \frac{1}{|k \cdot \omega|}.
\]
Thus,
\[
B_2 \leq \sum_{n \geq 0} \frac{1}{2^{(j_n - 1)/s}} \max_{0 < \|k\| \leq 2^n} \log \frac{1}{|k \cdot \omega|} \leq 2^{1/s} B'_1.
\]
Choose now $i_n \in \mathbb{N}$ for each $n \in \mathbb{N}$ such that
\[
\|\hat{p}_{i_n}\| = \max\{\|\hat{p}_k\| : \|\hat{p}_k\| \leq 2^n, k \in \mathbb{N}\}.
\]
So,
\[
B'_1 \leq \sum_{n \geq 0} \frac{1}{\|\hat{p}_{i_n}\|^{1/s}} \max_{\|k\| = \|\hat{p}_{i_n}\|} \log \frac{1}{|k \cdot \omega|} \leq B_2.
\]
Using Lemma 3.1 we get
\[
B_3 = \frac{1}{d} \sum_{n \geq 0} \frac{1}{\|\hat{p}_n\|^{1/s}} \log \frac{\|\hat{p}_{n+1}\|}{|p_n \cdot \omega|} \\
\leq \frac{1}{d - 1} \sum_{n \geq 0} \frac{1}{\|\hat{p}_n\|^{1/s}} \log \frac{\delta_0}{|p_n \cdot \omega|} \\
= \frac{1 + \xi}{d - 1} \sum_{n \geq 0} \frac{1}{\|\hat{p}_n\|^{1/s}} \log \frac{1}{|p_n \cdot \omega|} \\
= \frac{1 + \xi}{d - 1} B_2,
\]
where $\xi = -\log \delta_0 / \log |p_0 \cdot \omega|$ and we have used the fact that $|p_n \cdot \omega| \leq |p_0 \cdot \omega|$.
Finally, by (3.5) and (3.6)
\[
B_2 = \sum_{n \geq 0} \frac{1}{\|\hat{p}_n\|^{1/s}} \log \frac{1}{|p_n \cdot \omega|} \\
= \sum_{n \geq 0} e^{-\frac{1}{s}(\tau_{n+1} - W(\tau_n))} (d\tau_{n+1} - \log \|\hat{p}_{n+1}\|) \\
\leq dB_3.
\]

**Proposition 3.7.** Let $\rho > 1$ and $\{t_n\}_{n \geq 0}$ a sequence of non-negative real numbers satisfying $\frac{t_{n+1}}{t_n} \geq \rho$ for every $n \geq 0$. If $\omega \in BC(s)$, then
\[
\sum_{n=1}^{\infty} e^{-\frac{1}{s}(t_{n+1} - W(t_n))} t_n < \infty.
\]
Proof. Notice that,
\[
\sum_{n=1}^{\infty} e^{-\frac{1}{2} (t_n - W(t_n))}(t_n - t_{n-1}) < \int_0^{\infty} e^{-\frac{1}{2}(t-W(t))} dt < \sum_{n=0}^{\infty} e^{-\frac{1}{2}(\tau_n - W(\tau_n))}r_{n+1}.
\]
Moreover,
\[
\sum_{n=1}^{\infty} e^{-\frac{1}{2} (t_n - W(t_n))}t_n = \sum_{n=1}^{\infty} e^{-\frac{1}{2} (t_n - W(t_n))}(t_n - t_{n-1}) + \sum_{n=1}^{\infty} e^{-\frac{1}{2} (t_n - W(t_n))}t_{n-1}
\]
\[
\leq \sum_{n=1}^{\infty} e^{-\frac{1}{2} (t_n - W(t_n))}(t_n - t_{n-1}) + \frac{1}{\rho} \sum_{n=1}^{\infty} e^{-\frac{1}{2} (t_n - W(t_n))}t_n.
\]
Hence,
\[
\sum_{n=1}^{\infty} e^{-\frac{1}{2} (t_n - W(t_n))}t_n \leq \left(1 - \frac{1}{\rho}\right)^{-1} \sum_{n=0}^{\infty} e^{-\frac{1}{2} (\tau_n - W(\tau_n))}r_{n+1} < \infty
\]
by Proposition 3.6.

3.3. Contraction of orthogonal cones. Consider any strictly increasing unbounded sequence \(t_n > 0, n \in \mathbb{N}\), and set \(t_0 = 0\). Let
\[M_n := \Phi^{t_n}(M_0)\]
a sequence of points in the orbit of \(M_0\). This is computed using a matrix \(P_n \in \Gamma\) such that \(M_n\) is in \(\mathcal{F}\). That is,
\[
M_n = P_nM_0E^{t_n} = \begin{bmatrix}
\hat{p}_n^{(1)} e^{-t_n} (p_n^{(1)} \cdot \omega)e^{(d-1)t_n} \\
\vdots \\
\hat{p}_n^{(d)} e^{-t_n} (p_n^{(d)} \cdot \omega)e^{(d-1)t_n}
\end{bmatrix}
\]
where \(p_n^{(i)} = e_i^T P_n\) is the \(i\)-th row of \(P_n\) since \(e_i\) is the \(i\)-th vector of the canonical basis of \(\mathbb{R}^d\). Moreover, set \(P_0 = I\).

The last column of \(M_n\) is
\[
\omega_n := M_n e_d = \lambda_n P_n \omega, \quad \lambda_n := e^{(d-1)t_n}.
\]
Notice that \(\omega_0 = \omega\). In addition, we define the matrices
\[T_n := P_n P_{n-1}^{-1} \in \Gamma\]
so that \(\omega_n = \eta_n T_n \omega_{n-1}\) with
\[
\eta_n = \frac{\lambda_n}{\lambda_{n-1}} = e^{(d-1)(t_n - t_{n-1})}
\]
and \(P_n = T_n \ldots T_1\) for any \(n \in \mathbb{N}\).

Lemma 3.8. For every \(n \geq 1\) the following holds:
Lemma 3.9. If $v$ is orthogonal to $\omega$, then

\[ |w_n| \leq C |v| e^{-(d-1)\omega + dW_n}, \]

\[ |P_n| \leq C_1 |v| e^{\epsilon_n W_n + dW_n}, \]

\[ |P_n| \leq C_2 |v| e^{\epsilon_n (t_n - W_n) + dW_n}, \]

\[ |T_n| \leq C_1 C_2 e^{-(d-1)(t_n - W_n) + dW_n}. \]

where $C_1$ and $C_2$ are the constants in Proposition 3.2 and $W_n = W(t_n)$.

Proof. This follows immediately from Proposition 3.2. Notice that $T_n = M_n e^{-(t_n - W_n) M_n^{-1}}.

The hyperbolicity of the matrices $T_n^{-1}$, $n \geq 1$, can be derived by looking at the contraction of the subspace $S_{n-1} = \{v \in \mathbb{R}^d : v \cdot \omega_{n-1} = 0\}$ orthogonal to $\omega_{n-1}$.

Denote by $\tilde{P}_n$ the matrix $P_n$ with zeros on its last column.

Lemma 3.9. If $v \in S_{n-1}$, then

\[ |T_n^{-T} v| \leq e^{-\epsilon_n} |M_n^{-T}| |\tilde{P}_n^{-T}| |v|. \]

Proof. Firstly, since $\omega_{n-1}$ is given by the last column of $M_{n-1}$, any $v \in S_{n-1}$ is orthogonal to it. Recall also that $T_n = P_n P_n^{-1}$. Thus,

\[
T_n^{-T} v = P_n^{-T} P_n^{-1} v
= M_n^{-T} E_{\omega_n} M_{n-1}^{-T} E_{\omega_n} M_{n-1}^{-T} v
= M_n^{-T} \begin{bmatrix}
(p_n^{(1)})^T e^{-\epsilon_n} & \ldots & (p_n^{(d)})^T e^{-\epsilon_n}
\end{bmatrix}
\begin{bmatrix}
(p_n^{(1)})^T 
\omega) e^{(d-1)\omega} & \ldots & (p_n^{(d)})^T 
\omega) e^{(d-1)\omega}
\end{bmatrix} v
= e^{-\epsilon_n} M_n^{-T} \begin{bmatrix}
(p_n^{(1)})^T & \ldots & (p_n^{(d)})^T
0 & \ldots & 0
\end{bmatrix} v.
\]

Given a sequence $\sigma_n > 0$ consider the following cones of integers

\[ I_n^+ := \{k \in \mathbb{Z}^d : |\omega_n \cdot k| \leq \sigma_n |k|\} \quad \text{and} \quad I_n^- := \mathbb{Z}^d \setminus I_n^+. \]

We will refer the vectors in $I_n^+$ as resonant and in $I_n^-$ as far from resonant. Let

\[ A_n = A_n(\sigma_{n-1}, \omega_{n-1}) := \sup_{k \in I_n^+ \setminus \{0\}} \frac{|T_n^{-T} k|}{|k|}, \]

\[ B_n = B_n(\sigma_n, \omega_n) := \sup_{k \in I_n^-} \frac{|P_n^{-T} k|}{|k|}. \]
Proposition 3.10. For any \( n \geq 1 \)

\[
A_n \leq \frac{\sigma_{n-1}|\omega_{n-1}|}{\omega_{n-1} \cdot \omega_{n-1}} |T_n^{-\top}| + e^{-t_n} |M_n^{-\top}| |\hat{P}_{n-1}^\top|,
\]

(3.9)

where \( C_1 \) and \( C_2 \) are the constants in Proposition 3.2.

Proof. Any \( k \in I_{n-1}^+ \backslash \{0\} \) can be written as \( k = k_1 + k_2 \) where

\[
k_1 = \frac{k \cdot \omega_{n-1}}{\omega_{n-1} \cdot \omega_{n-1}} \omega_{n-1} \quad \text{and} \quad k_2 \in S_{n-1}^+.
\]

Hence,

\[
|T_n^{-\top} k| \leq |T_n^{-\top} k_1| + |T_n^{-\top} k_2| \\
\leq \left( \frac{\sigma_{n-1}|\omega_{n-1}|}{\omega_{n-1} \cdot \omega_{n-1}} |T_n^{-\top}| + e^{-t_n} |M_n^{-\top}| |\hat{P}_{n-1}^\top| \right) |k|.
\]

(3.10)

Let

\[
\Delta(t) = \tau_{k(t)} - W(\tau_{k(t)})
\]

where \( k(t) = \max\{j \in \mathbb{N}_0 : \tau_j \leq t\} \). Notice that

\[
\Delta(t_n) \leq t - W(t), \quad \tau_{k_n} \leq t < \tau_{k_n+1},
\]

where \( k_n = k(t_n) \). Moreover \( \Delta(t) \) is non-decreasing. Let \( \Delta_n = \Delta(t_n) \).

Thus,

\[
|\hat{P}_n^\top| = \max_{i=1,\ldots,d} |\hat{p}_n^{(i)}| = |\hat{p}_n| = \|\hat{p}_n\| = e^{\Delta_n}
\]

(3.11)

by the fact that the first column on \( M_n \) is always a best diophantine approximation [18, 8] and (3.6).

Lemma 3.11. If for every \( n \geq 1 \), \( \xi_n > 0 \) and

\[
\sigma_n \leq \xi_n C_1^{-1} e^{-(d-1)(t_{n+1} - t_n) - (d-1)W_n - t_n + \Delta_n},
\]

then

1. \( A_n \leq (1 + \xi_n)C_2 e^{-\Delta_n + \Delta_n -} \)
2. \( A_1 \cdots A_n \leq (1 + \xi_n)^n C_2^n e^{-\Delta_n} \)
3. \( A_1 \cdots A_n B_n \leq |\omega| C_1 (1 + \xi_n)^n C_2^n e^{-\Delta_n + t_n - W_n + dW_n} \)

where \( C_1 \) and \( C_2 \) are the constants in Proposition 3.2.

Proof. It follows from Lemmas 3.8, Proposition 3.10, and (3.11). Notice that we use the following relations: \( v \cdot v \geq |v|^2/d \) and \( |\omega_n| \geq 1 \).
4. Functional Spaces

4.1. Gevrey spaces. Let $\mathbb{T}^d = \mathbb{R}^d/(2\pi\mathbb{Z})^d$ with $d \geq 2$. The set of smooth $\mathbb{R}$-valued $2\pi\mathbb{Z}^d$-periodic functions on $\mathbb{R}^d$ is denoted by $C^\infty(\mathbb{T}^d)$. In the following we shall use multi-index notation. So given $\alpha = (\alpha_1, \ldots, \alpha_d) \in \mathbb{N}_0^d$, where $\mathbb{N}_0 = \{0, 1, 2, \ldots\}$, we write

$$\alpha! = \alpha_1! \cdots \alpha_d!, \quad |\alpha| = \alpha_1 + \cdots + \alpha_d \quad \text{and} \quad \partial^\alpha = \partial^\alpha_{x_1} \cdots \partial^\alpha_{x_d}$$

for the derivatives. The sup-norm of $f \in C^\infty(\mathbb{T}^d)$ is defined as

$$\|f\|_{C^0} := \max_{x \in \mathbb{R}^d} |f(x)|.$$

A smooth function $f \in C^\infty(\mathbb{T}^d)$ is $s$-Gevrey with $s \geq 1$ if there exist constants $C > 0$ and $\rho > 0$ such that

$$\|\partial^\alpha f\|_{C^0} \leq C \alpha!^s \rho^{-s|\alpha|}, \quad \alpha \in \mathbb{N}_0^d.$$

Gevrey functions constitute an intermediate regularity class between smooth ($s = +\infty$) and real-analytic functions ($s = 1$). Every $1$-Gevrey function is real-analytic because its Taylor series converges in a complex strip of radius $\rho$.

It is worthwhile observing that, unlike analytic functions, it is possible to construct $s$-Gevrey functions supported on any compact subset if $s > 1$.

Remark 4.1. The above definition of $s$-Gevrey function requires

$$\|\partial^\alpha f\|_{C^0} \leq C \frac{\alpha!^s}{\rho^{-s|\alpha|}} \quad \alpha \in \mathbb{N}_0^d.$$

Fixing the constant $\rho > 0$, Marco and Sauzin have defined the following spaces of Gevrey functions $[24]$. A smooth function $f \in C^\infty(\mathbb{T}^d)$ belongs to $C_{s,\rho}(\mathbb{T}^d)$ if

$$\|f\|_{C_{s,\rho}} := \sum_{\alpha \in \mathbb{N}_0^d} \frac{\rho^{-s|\alpha|}}{\alpha!^s} \|\partial^\alpha f\|_{C^0} < \infty.$$

The advantage of introducing this norm is that $C_{s,\rho}(\mathbb{T}^d)$ becomes a Banach algebra $[24]$. It is also clear that $\|f\|_{C_{s,\rho}} < \|f\|_{C_{s,\rho'}}$ for $0 < \rho' < \rho$ and that any $s$-Gevrey function belongs to $C_{s,\rho}(\mathbb{T}^d)$ for some $\rho > 0$.

That is, the set of $s$-Gevrey functions is $\bigcup_{\rho > 0} C_{s,\rho}(\mathbb{T}^d)$. Moreover, we have the following Cauchy-type estimate.

Lemma 4.2 ([24, Lemma A.2.]). If $0 < \rho' < \rho$ and $f \in C_{s,\rho}(\mathbb{T}^d)$, then for every $\alpha \in \mathbb{N}_0^d$ the partial derivative $\partial^\alpha f$ belongs to $C_{s,\rho'}(\mathbb{T}^d)$ and

$$\sum_{|\alpha| = n} \|\partial^\alpha f\|_{C_{s,\rho'}} \leq \frac{n!^s}{(\rho - \rho')^{ns}} \|f\|_{C_{s,\rho}}.$$
Another important property of Gevrey functions is that the composition of Gevrey functions is again Gevrey.

**Theorem 4.3** ([24, Corollary A.1.]). If \( 0 < d^{\frac{1}{n}} \rho' < \rho \), \( f \in C_{s,\rho}(\mathbb{T}^d) \) and \( u = (u_1, \ldots, u_d) \) with \( u_i \in C_{s,\rho}(\mathbb{T}^d) \) such that

\[
\| u_i \|_{C_{s,\rho}} \leq \frac{\rho^s}{d^{s-1}} - \rho'^s,
\]

then \( f \circ (\text{Id} + u) \in C_{s,\rho'}(\mathbb{T}^d) \) and \( \| f \circ (\text{Id} + u) \|_{C_{s,\rho}} \leq \| f \|_{C_{s,\rho}} \).

Other interesting results about Gevrey functions can be found in [24, Appendix A]. See also [27].

We denote by \( C^\infty(\mathbb{T}^d, \mathbb{R}^d) \) the set of smooth \( \mathbb{R}^d \)-valued \( 2\pi \mathbb{Z}^d \)-periodic functions on \( \mathbb{R}^d \). Given \( f = (f_1, \ldots, f_d) \in C^\infty(\mathbb{T}^d, \mathbb{R}^d) \) and \( \rho > 0 \) we define the following \( s \)-Gevrey norm,

\[
\| f \|_{C_{s,\rho}} := \| f_1 \|_{C_{s,\rho}} + \cdots + \| f_d \|_{C_{s,\rho}}.
\]

Similarly, we denote by \( C_{s,\rho}(\mathbb{T}^d, \mathbb{R}^d) \) the set of \( \mathbb{R}^d \)-valued \( s \)-Gevrey functions that satisfy \( \| f \|_{C_{s,\rho}} < \infty \), which is a Banach space. Both Lemma 4.2 and Theorem 4.3 hold for \( \mathbb{R}^d \)-valued \( s \)-Gevrey functions.

Given \( f \in C_{s,\rho}(\mathbb{T}^d, \mathbb{R}^d) \), the derivative \( Df \) can be seen as a continuous linear operator defined on \( C_{s,\rho}(\mathbb{T}^d, \mathbb{R}^d) \). Denote by \( \| Df \|_{C_{s,\rho}} \), the induced operator norm, i.e.

\[
\| Df \|_{C_{s,\rho}} := \max_{1 \leq j \leq d} \sum_{i=1}^d \| \partial^{\alpha} f_i \|_{C_{s,\rho}} = \max_{|\alpha| = 1} \| \partial^{\alpha} f \|_{C_{s,\rho}},
\]

where \( e_j \) are the canonical basis vectors of \( \mathbb{R}^d \).

Denote by \( C'_{s,\rho}(\mathbb{T}^d, \mathbb{R}^d) \) the set of \( s \)-Gevrey functions that satisfy

\[
\| f \|_{C'_{s,\rho}} := \| f \|_{C_{s,\rho}} + \| Df \|_{C_{s,\rho}} < \infty.
\]

The set \( C'_{s,\rho}(\mathbb{T}^d, \mathbb{R}^d) \) together with the norm \( \| \cdot \|_{C'_{s,\rho}} \) is a Banach space contained in \( C_{s,\rho}(\mathbb{T}^d, \mathbb{R}^d) \).

Since \( s \) will be fixed, in order to simplify the notation we shall write \( C_{\rho} \) and \( C'_{\rho} \) in place of \( C_{s,\rho}(\mathbb{T}^d, \mathbb{R}^d) \) and \( C'_{s,\rho}(\mathbb{T}^d, \mathbb{R}^d) \), respectively.

**Lemma 4.4.** If \( 0 < d^{\frac{1}{n}} \rho' < \rho \), \( f \in C'_{\rho} \) and \( u \in C_{\rho} \) such that

\[
\| u \|_{C_{\rho}} \leq \frac{\rho^s}{d^{s-1}} - \rho'^s,
\]

then

1. \( \| Df \circ (\text{Id} + u) \|_{C'_{\rho}} \leq \| Df \|_{C_{\rho}}, \)
2. \( \| f \circ (\text{Id} + u) \|_{C'_{\rho}} \leq \| Df \|_{C_{\rho}} \| u \|_{C_{\rho}}. \)

Moreover, if

\[
\| u \|_{C_{\rho}} \leq \frac{(\rho + d^{\frac{1}{n}} \rho')^s}{2^s d^{s-1}} - \rho'^s,
\]

then
(3) $\|f \circ (\text{Id} + u) - f\|_{c_{\rho'}} \leq \frac{2^s}{(\rho - d^{s-1} \rho')^s} \|f\|_{c_{\rho}} \|u\|_{c_{\rho'}}$.

(4) $\|Df \circ (\text{Id} + u) - Df\|_{c_{\rho'}} \leq \frac{2^s}{(\rho - d^{s-1} \rho')^s} \|Df\|_{c_{\rho}} \|u\|_{c_{\rho'}}$.

**Proof.**

(1) From the definitions of the norms and Theorem 4.3 one gets

$$\|Df \circ (\text{Id} + u)\|_{c_{\rho'}} = \max_{|\alpha|=1} \|\partial^\alpha f \circ (\text{Id} + u)\|_{c_{\rho'}}$$

$$\leq \max_{|\alpha|=1} \|\partial^\alpha f\|_{c_{\rho'}} = \|Df\|_{c_{\rho'}}$$

$$\leq \|f\|_{c_{\rho'}}.$$  

(2) Fix $x \in \mathbb{R}^d$ and write $g_i(t) = f_i(x + tu)$ with $g'_i(t) = Df_i(x + tu)$ $u$. Then,

$$f(x + u) - f(x) = \int_0^1 Df(x + tu) u \, dt.$$  

Using (1) we obtain

$$\|f \circ (\text{Id} + u) - f\|_{c_{\rho'}} \leq \max_{0 \leq t \leq 1} \|Df \circ (\text{Id} + tu)\|_{c_{\rho'}} \|u\|_{c_{\rho'}}$$

$$\leq \|Df\|_{c_{\rho'}} \|u\|_{c_{\rho'}}.$$  

(3) The estimate (2) with $\rho$ replaced by $\tilde{\rho} := (\rho + d^{s-1} \rho')/2 > d^{s-1} \rho'$ yields

$$\|f \circ (\text{Id} + u) - f\|_{c_{\rho'}} \leq \|Df\|_{c_{\tilde{\rho}'}} \|u\|_{c_{\tilde{\rho}'}}$$

and Lemma 4.2 implies that

$$\|Df\|_{c_{\tilde{\rho}'}} \leq \frac{2^s}{(\rho - \tilde{\rho})^s} \|f\|_{c_{\rho'}}.$$  

(4) By (2) we get

$$\|Df \circ (\text{Id} + u) - Df\|_{c_{\rho'}} = \max_{|\alpha|=1} \|\partial^\alpha f \circ (\text{Id} + u) - \partial^\alpha f\|_{c_{\rho'}}$$

$$\leq \max_{|\alpha|=1} \|D\partial^\alpha f\|_{c_{\tilde{\rho}'}} \|u\|_{c_{\tilde{\rho}'}}.$$  

Finally, Lemma 4.2 implies that

$$\|D\partial^\alpha f\|_{c_{\tilde{\rho}'}} = \max_{|\beta|=1} \|\partial^\beta \partial^\alpha f\|_{c_{\tilde{\rho}'}} \leq \frac{1}{(\rho - \tilde{\rho})^s} \|\partial^\alpha f\|_{c_{\rho'}}.$$  

Therefore,

$$\|Df \circ (\text{Id} + u) - Df\|_{c_{\rho'}} \leq \frac{2^s}{(\rho - d^{s-1} \rho')^s} \|Df\|_{c_{\rho'}} \|u\|_{c_{\rho'}}.$$

$\square$
Lemma 4.5. If for each $n \geq 1$ we have $0 < d^{\frac{z-1}{2}} \rho_n < \rho_{n-1}$ and $f_n - \text{Id} \in C_{\rho_n}$ such that

$$\|f_n - \text{Id}\|_{C_{\rho_n}} \leq \frac{\rho_{n-1}^s}{d^{s-1}} - \rho_n^s,$$

then

$$\|f_1 \circ \cdots \circ f_n - \text{Id}\|_{C_{\rho_n}} \leq \sum_{i=1}^{n} \|f_i - \text{Id}\|_{C_{\rho_i}}.$$

Proof. By writing $\varphi_n = f_n - \text{Id} \in C_{\rho_n}$, it is simple to check that

$$f_1 \circ \cdots \circ f_n - \text{Id} = \varphi_n + (f_1 \circ \cdots \circ f_{n-1} - \text{Id}) \circ (\text{Id} + \varphi_n).$$

Thus, by Theorem 4.3,

$$\|f_1 \circ \cdots \circ f_n - \text{Id}\|_{C_{\rho_n}} \leq \|\varphi_n\|_{C_{\rho_n}} + \|f_1 \circ \cdots \circ f_{n-1} - \text{Id}\|_{C_{\rho_{n-1}}}.$$

The claim follows immediately. \qed

Lemma 4.6. If for each $n \geq 1$ we have $0 < d^{\frac{z-1}{2}} \rho_n < \rho_{n-1}$ and $f_n - \text{Id} \in C_{\rho_n}$ such that

$$\|f_n - \text{Id}\|_{C_{\rho_n}} \leq \frac{(\rho_{n-1} + d^{\frac{z-1}{2}} \rho_n)^s}{2^s d^{s-1}} - \rho_n^s,$$

then

$$\|f_1 \circ \cdots \circ f_n - f_1 \circ \cdots \circ f_{n-1}\|_{C_{\rho_n}} \leq \left(1 + \frac{2^s}{(\rho_{n-1} - d^{\frac{z-1}{2}} \rho_n)^s} \sum_{i=1}^{n-1} \|f_i - \text{Id}\|_{C_{\rho_i}}\right) \|f_n - \text{Id}\|_{C_{\rho_n}}.$$  \hspace{1cm} (4.1)

Proof. Write $h_n = f_1 \circ \cdots \circ f_n$ and $\varphi_n = f_n - \text{Id} \in C_{\rho_n}$ for any $n \geq 1$. It is simple to check that

$$h_n - h_{n-1} = \varphi_n + \sum_{i=1}^{n-1} (\varphi_i \circ F_{i,n} - \varphi_i \circ F_{i,n-1}),$$

where

$$F_{m_1,m_2} := f_{m_1+1} \circ \cdots \circ f_{m_2}, \quad m_1 < m_2,$$

and $F_{m,m} = \text{Id}$. Clearly, $F_{i,n} = F_{i,n-1} \circ f_n$. So,

$$h_n - h_{n-1} = \varphi_n + \sum_{i=1}^{n-1} (\varphi_i \circ F_{i,n-1} \circ (\text{Id} + \varphi_n) - \varphi_i \circ F_{i,n-1}).$$

From Lemma 4.4,

$$\|\varphi_i \circ F_{i,n} - \varphi_i \circ F_{i,n-1}\|_{C_{\rho_n}} \leq \frac{2^s}{(\rho_{n-1} - d^{\frac{z-1}{2}} \rho_n)^s} \|\varphi_i \circ F_{i,n-1}\|_{C_{\rho_{n-1}}} \|\varphi_n\|_{C_{\rho_n}}.$$

Since $\varphi_i \circ F_{i,n-1} = \varphi_i \circ F_{i,n-2} \circ (\text{Id} + \varphi_{n-1})$, by Theorem 4.3,

$$\|\varphi_i \circ F_{i,n-1}\|_{C_{\rho_{n-1}}} \leq \|\varphi_i \circ F_{i,n-2}\|_{C_{\rho_{n-2}}} \leq \|\varphi_i\|_{C_{\rho_i}}.$
Finally,
\[ \|h_n - h_{n-1}\|_{c_{\rho}} \leq \left(1 + \frac{2^s}{(\rho_{n-1} - d^{-s-1}\rho_n)^s} \right) \|\tilde{\varphi}_n\|_{c_{\rho}} \|\tilde{\varphi}_n\|_{c_{\rho_n}}. \]

\[ \Box \]

4.2. Decay of Fourier coefficients. Any \( f \in C^\infty(T^d, \mathbb{R}) \) can be represented in Fourier series as
\[ f(x) = \sum_{k \in \mathbb{Z}^d} f_k e^{ik \cdot x}, \]
where
\[ f_k = \frac{1}{(2\pi)^d} \int_{T^d} f(x) e^{-ik \cdot x} dx. \]
We write the constant Fourier mode of \( f \) through the projection
\[ \mathbb{E} f = f_0. \] (4.2)
Let \( |k| = |k_1| + \cdots + |k_d| \) for \( k \in \mathbb{Z}^d \). The following is a well-known estimate, we include here a proof only for the convenience of the reader.

**Lemma 4.7 (Decay of Fourier coefficients).** If \( f \in C_\rho \), then
\[ |f_k| \leq \Delta \|f\|_{c_\rho} e^{-\rho|k|^{s/s}}, \quad k \in \mathbb{Z}^d, \]
where
\[ \Delta := (2\pi)^{-d} \left(1 - s^{-\frac{s}{s-1}}\right)^{-(s-1)d} < \left(\frac{e}{2\pi}\right)^d. \]

**Proof.** Since \( |(\partial^\alpha f)_k| \leq \frac{1}{(2\pi)^d} \|\partial^\alpha f\|_{c^0} \) we have
\[ \|f\|_{c_\rho} = \sum_{\alpha \in \mathbb{N}^d} \frac{\rho^{s|\alpha|}}{\alpha!^s} \|\partial^\alpha f\|_{c^0} \geq (2\pi)^d \sum_{\alpha \in \mathbb{N}^d} \frac{\rho^{s|\alpha|}}{\alpha!^s} |(\partial^\alpha f)_k|. \]
Taking into account that \( (\partial^\alpha f)_k = \prod_j (ik_j)^{|\alpha|} f_k \) we get,
\[ (2\pi)^d |f_k| \sum_{\alpha \in \mathbb{N}^d} \frac{\rho^{s|\alpha|}}{\alpha!^s} k^\alpha \leq \|f\|_{c_\rho}, \] (4.3)
where \( k^\alpha = \prod_{j=1}^d |k_j|^{\alpha_j} \). Now we estimate the sum \( \sum_{\alpha \in \mathbb{N}^d} \frac{\rho^{s|\alpha|}}{\alpha!^s} k^\alpha \) from below. Noticed that
\[ \sum_{\alpha \in \mathbb{N}^d} \frac{\rho^{s|\alpha|}}{\alpha!^s} k^\alpha = \prod_{j=1}^d \sum_{n=0}^\infty \frac{\rho^{sn}}{n!^s} |k_j|^n. \]
In order to estimate the sum inside the product we recall the Hölder inequality. For any sequences of positive real numbers \( (x_n)_{n \geq 0} \) and \( (y_n)_{n \geq 0} \) we have
\[ \left( \sum_{n=0}^\infty x_n y_n \right)^{s/t} \leq \left( \sum_{n=0}^\infty y_n^t \right)^{s/t} \sum_{n=0}^\infty x_n^s, \]
where \( t = \frac{s}{s-1} \). Taking

\[
x_n = \left( \frac{\rho \mid k_j \mid^{1/s} \mid^1}{n!} \right)^n \quad \text{and} \quad y_n = \frac{1}{s^n}
\]
we get

\[
e^{\rho \mid k_j \mid^{1/s}} \leq h(s) \sum_{n=0}^{\infty} \frac{\rho^n}{n!} \mid k_j \mid ^n,
\]
where \( h(s) := \left( 1 - s \frac{1}{s-1} \right)^{1-s} \). Notice that \( h'(s) > 0 \), \( h(1) = 1 \) and \( \lim_{s \to \infty} h(s) = e \). So \( 1 \leq h(s) < e \) for every \( s \geq 1 \). Since \( \sum_j \mid k_j \mid^{1/s} \geq \mid k \mid^{1/s} \), we get

\[
\sum_{\alpha \in \mathbb{N}_0^d} \frac{\rho^{\mid \alpha \mid}}{\alpha!} k^\alpha \geq \frac{1}{h^d} e^{\rho \mid k \mid^{1/s}}.
\]

Using this lower bound in (4.3) we obtain the desired estimate on the Fourier coefficients.

**Lemma 4.8.** For every \( \rho > 0 \) and \( k \in \mathbb{Z}^d \),

\[
\| e^{ik \cdot x} \|_{C^\rho} \leq e^{d \frac{s-1}{s} \rho \mid k \mid^{1/2}} \quad \text{and} \quad \| e^{ik \cdot x} \|'_{C^\rho} \leq \left( 1 + \mid k \mid \right) e^{d \frac{s-1}{s} \rho \mid k \mid^{1/2}}.
\]

**Proof.** We will prove only the first inequality. The second follows directly from the first and the definition of the norm. Notice that,

\[
\| e^{ik \cdot x} \|_{C^\rho} = \sum_{\alpha \in \mathbb{N}_0^d} \frac{\rho^{\mid \alpha \mid}}{\alpha!} k^\alpha = \sum_{n=0}^{\infty} \sum_{\mid \alpha \mid = n} \prod_{j=1}^{d} \frac{\mid k_j \mid^{\alpha_j}}{\alpha_j!} \rho^{\alpha_n} = \prod_{j=1}^{d} \sum_{n=0}^{\infty} \left( \frac{\mid k_j \mid^{\alpha_j}}{\alpha_j!} \rho \right)^n \leq \left( \prod_{j=1}^{d} \sum_{n=0}^{\infty} \frac{\mid k_j \mid^{\alpha_j}}{\alpha_j!} \rho \right)^s \leq e^{s \rho \sum_j \mid k_j \mid^{1/2}},
\]

where we have used the fact

\[
\sum_{n=0}^{\infty} \sum_{\mid \alpha \mid = n} \prod_{i=1}^{d} a_i(\alpha_i) = \prod_{i=1}^{d} \sum_{n=0}^{\infty} a_i(n)
\]

for any sequences \( a_i \) and (A.1).

Since \( \sum_j \mid k_j \mid^{1/2} \leq d \frac{s-1}{s} \mid k \mid^{1/2} \) from (A.2) we obtain the claimed estimate. \( \square \)
4.3. \textbf{Spaces} $\mathcal{F}_{s,\rho}$ and $\mathcal{F}'_{s,\rho}$. Lemma 4.7 motivates the following definition. Given $\rho > 0$ let $\mathcal{F}_{s,\rho}(\mathbb{T}^d)$ be the set of smooth functions $f \in C^\infty(\mathbb{T}^d)$ that satisfy

$$\|f\|_{\mathcal{F}_{s,\rho}} := \sum_{k \in \mathbb{Z}^d} |f_k| e^{\rho|k|^{1/s}} < \infty.$$ 

Several properties of this norm are easy to establish. Firstly, $\|f\|_{C^0} \leq \|f\|_{\mathcal{F}_{s,\rho}}$ for any $\rho > 0$. Secondly, $\|f\|_{\mathcal{F}_{s,\rho'}} \leq \|f\|_{\mathcal{F}_{s,\rho}}$ for every $\rho' < \rho$. Moreover, it is simple to check that $\mathcal{F}_{s,\rho}(\mathbb{T}^d)$ endowed with the norm $\|\cdot\|_{\rho}$ is a Banach algebra.

Given any $f = (f_1, \ldots, f_d) \in C^\infty(\mathbb{T}^d, \mathbb{R}^d)$ we define the following norm,

$$\|f\|_{\mathcal{F}'_{s,\rho}} := \sum_{k \in \mathbb{Z}^d} (1 + |k|) |f_k| e^{\rho|k|^{1/s}}$$

and define $\mathcal{F}'_{s,\rho}(\mathbb{T}^d, \mathbb{R}^d) \subset \mathcal{F}_{s,\rho}(\mathbb{T}^d, \mathbb{R}^d)$ to be the subset of Gevrey functions that have the above norm finite. Notice that,

$$\|f\|_{\mathcal{F}'_{s,\rho}} = \sum_{|\alpha|=1} \|\partial^\alpha f\|_{\mathcal{F}_{s,\rho}}.$$ 

To simplify the notation we shall denote these spaces by $\mathcal{F}_{s,\rho}$ and $\mathcal{F}'_{s,\rho}$, and when there is no need for the explicit dependence of $s$ we remove it from our notation.

It is clear that $\mathcal{F}'_{\rho}$ is also a Banach space. Moreover,

$$\|Df(h)\|_{\mathcal{F}_{\rho}} \leq \|f\|_{\mathcal{F}'_{\rho}} \|h\|_{\mathcal{F}_{\rho}}.$$ 

This means that $Df$ is a bounded operator on $\mathcal{F}_{\rho}$ whenever $f \in \mathcal{F}'_{\rho}$. We also denote by $\|Df\|_{\mathcal{F}_{\rho}}$ its induced norm.

Another useful property is the following upper-bound on the norm of the derivatives of a function.

\textbf{Lemma 4.9 (Cauchy’s estimate).} Given $\rho' < \rho$ and $f \in \mathcal{F}_{\rho}$,

$$\|\partial^\alpha f\|_{\mathcal{F}_{\rho'}} \leq \left( \frac{d^{\frac{s-1}{s}}}{\rho - \rho'} \right)^{|\alpha|} \alpha! \|f\|_{\mathcal{F}_{\rho}}.$$
Proof. Note that
\[ \| \partial^\alpha f \|_{F_{\rho'}} = \sum_{k \in \mathbb{Z}^d} |f_k| \prod_{j=1}^{d} |k_j|^{\alpha_j} e^{\rho'|k|^{1/s}} \]
\[ \leq \sum_{k \in \mathbb{Z}^d} |f_k| \left( \prod_{j=1}^{d} |k_j|^{\alpha_j} e^{-d^{1/s}(\rho-\rho')|k_j|^{1/s}} \right) e^{\rho'|k|^{1/s}} \]
where we have used the inequality \( d^{s-1} |k|^{1/s} \geq |k_1|^{1/s} + \ldots + |k_d|^{1/s} \). The function \( x \mapsto x^{\alpha_j} e^{-d^{1/s}((\rho-\rho')x^{1/s})} \) defined for \( x \geq 0 \) attains its maximum at \( x^* = \left( \frac{\alpha_j d^{1/s}}{\rho-\rho'} \right)^{s} \) with value \( \left( \frac{\alpha_j d^{1/s}}{e(\rho-\rho')} \right)^{s\alpha_j} \). Since \( (\alpha_j/e)^{\alpha_j} \leq \alpha_j \) by Stirling’s approximation, we get
\[ \| \partial^\alpha f \|_{F_{\rho'}} \leq \prod_{j=1}^{d} \left( \frac{\alpha_j d^{1/s}}{e(\rho-\rho')} \right)^{s\alpha_j} \sum_{k \in \mathbb{Z}^d} |f_k| e^{\rho'|k|^{1/s}} \]
\[ \leq \left( \frac{d^{1/s}}{\rho-\rho'} \right)^{s|\alpha|} \alpha! \| f \|_{F_{\rho'}}. \]

In the following lemma we show how the norms of the various Banach spaces are related. To simplify the notation we define the constants:
\[ \beta := d^{1/s} \quad \text{and} \quad C_\nu := \sum_{k \in \mathbb{Z}^d} e^{-\nu |k|^{1/s}}, \quad (4.4) \]
where \( \nu > 0 \).

**Lemma 4.10 (Inclusions).** Let \( \rho' > 0 \) and \( \nu > 0 \). The following holds:

1. If \( \rho \geq \beta \rho' + \nu \), then
\[ \| f \|_{C_{\rho'}} \leq \| f \|_{F_{\rho'}} \quad \text{and} \quad \| f \|_{C_{\nu}} \leq \| f \|_{F_{\rho'}}. \]

2. If \( \rho \geq \rho' + \nu \), then
\[ \| f \|_{F_{\rho'}} \leq C_\nu \| f \|_{C_{\nu}} \quad \text{and} \quad \| f \|_{F_{\rho'}} \leq C_\nu \| f \|_{C_{\nu}}. \]

**Proof.** By Lemma 4.8, we have
\[ \| f \|_{C_{\rho'}} \leq \sum_{k \in \mathbb{Z}^d} |f_k| e^{\rho'|k|^{1/s}} \leq C_\nu \sum_{k \in \mathbb{Z}^d} |f_k| e^{(\beta \rho' + \nu)|k|^{1/s}} = \| f \|_{F_{\beta \rho' + \nu}}. \]

\[ \text{Notice that } C_\nu \text{ can be bounded from above as follows,} \]
\[ C_\nu \leq 1 + \left( \frac{\pi^2}{3} \right)^d \left( \frac{\beta}{\nu} \right)^{2sd}. \]
This proves the first inequality of (1). Using Lemma 4.7 we get

\[ \|f\|_{F_{\rho'}} = \sum_{k \in \mathbb{Z}^d} |f_k|e^{\rho' |k|^{1/\alpha}} \leq C_\nu \|f\|_{c_{\nu'}} \]

which shows the first inequality of (2). The remaining inequalities are proved similarly. \(\square\)

**Remark 4.11.** It follows from the previous lemma that the set of \(s\)-Gevrey functions is given by \(\bigcup_{\rho > 0} F_{s,\rho}\).

**Proposition 4.12.** Given \(\rho > 0\) and \(0 < \nu < \rho/(1 + \beta + \beta^2)\) let

\[ \rho' := \frac{\rho - \nu}{\beta} \quad \text{and} \quad \rho'' := \frac{\rho' - \nu}{\beta} - \nu. \]

If \(f \in F_{\rho}\) and \(u \in F_{\rho'}\) such that

\[ \|u\|_{F_{\rho'}} \leq \frac{\rho'\nu}{d^{s-1}} - (\rho'' + \nu)^s, \]

then

1. \(\|f \circ (\text{Id} + u)\|_{F_{\rho'}} \leq C_\nu \|f\|_{F_{\rho'}}\)
2. \(\|Df \circ (\text{Id} + u)\|_{F_{\rho''}} \leq C_\nu \|f\|_{F_{\rho'}}\)
3. \(\|f \circ (\text{Id} + u) - f\|_{F_{\rho'}} \leq C_\nu \|f\|_{F_{\rho}}\|u\|_{F_{\rho'}}\)

Moreover, if \(f \in F_{\rho'}\) and,

\[ \|u\|_{F_{\rho'}} \leq \frac{\left(\rho' + d^{s-1} (\rho'' + \nu)^s\right)^s}{2^s d^{s-1}} - (\rho'' + \nu)^s \]

then

\[ \|Df \circ (\text{Id} + u) - Df\|_{F_{\rho''}} \leq \frac{2^s C_\nu \|f\|_{F_{\rho}}\|u\|_{F_{\rho'}}}. \]

**Proof.**

1. By (2) of Lemma 4.10,

\[ \|f \circ (\text{Id} + u)\|_{F_{\rho'}} \leq C_\nu \|f \circ (\text{Id} + u)\|_{c_{\nu'+\nu'}}. \]

Since, by (1) of Lemma 4.10,

\[ \|u\|_{c_{\nu'+\nu'}} \leq \frac{\rho'\nu}{d^{s-1}} - (\rho'' + \nu)^s, \]

we get by Theorem 4.3 and (1) of Lemma 4.10 that,

\[ \|f \circ (\text{Id} + u)\|_{F_{\rho'}} \leq C_\nu \|f\|_{c_{\nu'}} \leq C_\nu \|f\|_{F_{\rho'}}. \]

2. Similarly, by (2) of Lemma 4.10,

\[ \|Df \circ (\text{Id} + u)\|_{F_{\rho''}} \leq C_\nu \|Df \circ (\text{Id} + u)\|_{c_{\nu'+\nu'}}. \]

Thus, by (1) of Lemma 4.4,

\[ \|Df \circ (\text{Id} + u)\|_{F_{\rho'}} \leq C_\nu \|Df\|_{c_{\nu'}} \leq C_\nu \|f\|_{F_{\rho'}}. \]
(3) Arguing as before we conclude using Lemma 4.10 and (2) of Lemma 4.4 that,

\[
\| f \circ (\text{Id} + u) - f \|_{\mathcal{F}_{\rho''}} \leq C_{\nu} \| f \circ (\text{Id} + u) - f \|_{c_{\rho''}}
\]

\[
\leq C_{\nu} \| Df \|_{c_{\rho'}} \| u \|_{c_{\rho''}}
\]

\[
\leq C_{\nu} \| f \|_{\mathcal{F}_{\rho}} \| u \|_{\mathcal{F}_{\rho'}}.
\]

To prove the last estimate we can apply (4.4) of Lemma 4.4 to get

\[
\| Df \circ (\text{Id} + u) - Df \|_{\mathcal{F}_{\rho'}} \leq C_{\nu} \| Df \circ (\text{Id} + u) - Df \|_{c_{\rho''}}
\]

\[
\leq C_{\nu} \left( \frac{2^s}{(\rho'' - d^{-1})(\rho'' + \nu)^s} \right) \| Df \|_{c_{\rho'}} \| u \|_{c_{\rho''}}
\]

\[
\leq 2^s C_{\nu} \| f \|_{\mathcal{F}_{\rho}} \| u \|_{\mathcal{F}_{\rho'}}.
\]

\[\square\]

Since \( \mathcal{F}_\rho \subset \mathcal{F}_{\rho - \log \phi} \) whenever \( \phi \geq 1 \), consider the inclusion operator \( \mathcal{I}_\phi: \mathcal{F}_\rho \to \mathcal{F}_{\rho - \log \phi} \). Notice that \( \mathcal{I}_\phi \circ \mathcal{E} = \mathcal{E} \circ \mathcal{I}_\phi = \mathcal{E} \). When restricted to non-constant modes, its norm can be estimated as follows.

**Lemma 4.13.** If \( \phi \geq 1 \), then \( \| \mathcal{I}_\phi (\mathcal{I} - \mathcal{E}) \| \leq \phi^{-1} \).

**Proof.** This follows simply by noticing that

\[
\| (\mathcal{I} - \mathcal{E}) f \|_{\mathcal{F}_{\rho - \log \phi}} = \sum_{k \neq 0} (1 + |k|) |f_k| e^{(\rho - \log \phi)|k|} \leq \phi^{-1} \| f \|_{\mathcal{F}_\rho}
\]

\[\square\]

### 5. Coordinate Transformations and Time Reparametrization

A coordinate transformation \( \phi \) on the \( d \)-torus \( T^d \) is a diffeomorphism isotopic to a matrix in \( SL(d, \mathbb{Z}) \). That is, \( \psi = \phi \circ A \) where \( A \in SL(d, \mathbb{Z}) \) and \( \phi: T^d \to T^d \) is an isotopic to the identity diffeomorphism, meaning that \( \phi - \text{Id} \) is \( 2\pi \mathbb{Z}^d \)-periodic.

A vector field \( X \) on \( T^d \) written on new coordinates \( \psi \) is denoted by

\[
\psi^* X = (D\psi)^{-1} X \circ \psi.
\]

Notice that the set of vector fields on \( T^d \) can be identified with the set of functions from \( T^d \) to \( \mathbb{R}^d \), i.e. \( 2\pi \mathbb{Z}^d \)-periodic maps of \( \mathbb{R}^d \).

Since \( s \geq 1 \) is fixed throughout the paper and only the Banach spaces \( \mathcal{F}_\rho \) and \( \mathcal{F}'_\rho \) will be used, we shall simplify the notation by denoting their norms by \( \| \cdot \|_\rho \) and \( \| \cdot \|'_{\rho} \), respectively.
5.1. Elimination of far from resonance modes. Fix $w \in \mathbb{R}^d$.
Given $\sigma > 0$ we call far from resonance modes to the Fourier modes
with indices in
\[ I_{\sigma, w}^- = \{ k \in \mathbb{Z}^d : |w \cdot k| > \sigma |k| \}. \tag{5.1} \]
The resonant modes are the ones in $I_{\sigma, w}^+ = \mathbb{Z}^d \setminus I_{\sigma, w}^-$. We also define the projections $I_{\sigma, w}^+$ and $I_{\sigma, w}^-$ over the spaces of functions by restricting the modes to $I_{\sigma, w}^+$ and $I_{\sigma, w}^-$, respectively. Clearly, $I = I_{\sigma, w}^+ + I_{\sigma, w}^-$ where $I$ is the identity operator. Moreover, $\| I_{\sigma, w}^\pm \|_\rho \leq 1$. To simplify the notation we occasionally omit the dependence of $I_{\sigma, w}^\pm$ and $I_{\sigma, w}^\mp$ from $w$.

Given $\rho > 0$ and $\varepsilon > 0$, we denote by $V_\varepsilon$ the set
\[ V_\varepsilon = \{ w + f \in \mathcal{F}_\rho' : \| f \|_{\rho'} < \varepsilon \}. \tag{5.2} \]
The following theorem is an adaptation of a result in [19, 10] to the Gevrey class. For the convenience of the reader a proof can be found in the appendix.

**Theorem 5.1.** Given $0 < \sigma < |w|$, $\rho > 0$ and $0 < \nu < \rho/(1 + \beta + \beta^2)$, let
\[ \varepsilon = \varepsilon(\sigma, \nu, |w|, s, d) := \sigma \left| \frac{\nu^s}{8(C_\nu - 1)} \min \left\{ \frac{\sigma}{(2\beta)^s}, \frac{\sigma}{8|w|C_\nu \left( \frac{2s}{\nu^s + 7} \right)^{-1}} \right\} \right. \tag{5.3} \]
and
\[ \rho' := \frac{\rho - \nu}{\beta} \quad \text{and} \quad \rho'' := \frac{\rho' - \nu}{\beta} - \nu. \]
There exist a smooth homotopy of Fréchet differentiable maps $U_t : V_\varepsilon \to \mathbb{R} F_{\rho'}$ and $U_t : V_\varepsilon \to (1 - t) \mathbb{R} F_{\rho'} \oplus t \mathbb{R} F_{\rho''}$ such that
\[ U_t(X) = (\text{Id} + U_t(X))^* X \]
and
\[ \mathbb{R} U_t(X) = (1 - t) \mathbb{R} X, \quad t \in [0, 1]. \tag{5.4} \]
Moreover,
\[ \| U_t(X) \|_{\rho''} \leq \frac{8t(C_\nu - 1)}{\sigma} \| \mathbb{R} X \|_{\rho'}, \tag{5.5} \]
and
\[ \| U_t(X) - w \|_{\rho''} \leq \| \mathbb{R}^+(X - w) \|_{\rho''} + (1 - t) \| \mathbb{R}^-(X) \|_{\rho''} + \frac{2t|w|(C_\nu - 1)(2C_\nu - 1)}{\sigma^2} \| X - w \|_{\rho'}^2. \tag{5.6} \]

**Remark 5.2.** It follows from the definition of $\varepsilon$ and estimate (5.6) that,
\[ \| U_t(X) - w \|_{\rho''} \leq (8 - t) \| X - w \|_{\rho'}. \]
5.2. **Rescaling.** A fundamental step in the renormalization scheme is a linear transformation of the domain of definition of our vector fields. Suppose that $T \in \text{SL}(d, \mathbb{Z})$ and $\eta \in \mathbb{R} \setminus \{0\}$. Consider $X \in \mathcal{F}_\rho$. We are interested in the following coordinate and time linear changes:

$$x \mapsto T^{-1}x, \quad t \mapsto \eta t. \quad (5.7)$$

Notice that $\eta < 0$ means inverting the direction of time. These changes determine a new vector field as the image of the map

$$X \mapsto \mathcal{T}(X) := \eta (T^{-1})^* X.$$  

It is simple to check that $E \circ \mathcal{T} = \mathcal{T} \circ E$.

Let $|T|$ denote the induced norm of the matrix $T$, i.e.

$$|T| = \max_{1 \leq j \leq d} \sum_{i=1}^{d} |T_{i,j}|$$

where $T_{i,j}$ is the $i,j$ entry of $T$. Clearly, $|T| \in \mathbb{N}$.

Given $\sigma > 0$ and $w \in \mathbb{R} \setminus \{0\}$, define

$$A := \sup_{k \in I^+_{\sigma,w} \setminus \{0\}} \frac{|T^{-\top}k|}{|k|}.$$  

**Lemma 5.3.** Let $\rho > 0$, $0 < \delta < \rho/A^{1/s}$ and

$$\rho' := \frac{\rho}{A^{1/s}} - \delta. \quad (5.8)$$

The linear operator $\mathcal{T}(I^+_{\sigma,w} - E)$ maps $\mathcal{F}_\rho$ into $(I - E)\mathcal{F}_{\rho'}$ and satisfies

$$\|\mathcal{T}(I^+_{\sigma,w} - E)\| \leq |\eta| |T| \left(1 + \frac{s^s}{\delta^s}\right). \quad (5.9)$$

**Proof.** Let $f \in (I^+_{\sigma,w} - E)\mathcal{F}_\rho$. Then,

$$\|f \circ T^{-1}\|_{\mathcal{F}_{\rho'}} \leq \sum_{k \in I^+_{\sigma,w} \setminus \{0\}} (1 + |T^{-\top}k|) |f_k| e^{(\rho' - \delta) |T^{-\top}k|^{1/s}}.$$  

Using the inequality $\xi e^{-\delta \xi^{1/s}} \leq (\frac{s}{s})^s$ with $\xi \geq 0$, we get

$$\|f \circ T^{-1}\|_{\mathcal{F}_{\rho'}} \leq \left(1 + \frac{s^s}{\delta^s}\right) \sum_{k \in I^+_{\sigma,w} \setminus \{0\}} |f_k| e^{A^{1/s}(\rho' - \delta)|k|^{1/s}}$$  

$$\leq \left(1 + \frac{s^s}{\delta^s}\right) \|f\|_{\mathcal{F}_{\rho'}}.$$  

Finally, $\|\mathcal{T}f\|_{\mathcal{F}_{\rho'}} \leq |\eta| |T| \|f \circ T^{-1}\|_{\mathcal{F}_{\rho'}}$. \hfill \Box

Given $P \in \text{SL}(d, \mathbb{Z})$, $\sigma > 0$ and $w \in \mathbb{R} \setminus \{0\}$, define

$$B := \sup_{k \in I^+_{\sigma,w}} \frac{|P^\top k|}{|k|}.$$
Lemma 5.4. Let $\rho > 0$ and

$$\rho' := \frac{\rho}{B^{1/s}}.$$  

The linear operator $\tau: f \mapsto f \circ P$ maps $I_{\sigma,w}^{-}F_{\rho}$ into $(I-E)F_{\rho'}$ and satisfies $\|\tau \circ I_{\sigma,w}\| \leq 1$.

Proof. Let $f \in I_{\sigma,w}^{-}F_{\rho}$. Then,

$$\|f \circ P\|_{F_{\rho'}} = \sum_{k \in I_{\sigma,w}^{-}} |f_k|e^{\rho'(P^k)\beta |k|^{1/s}} \leq \sum_{k \in I_{\sigma,w}^{-}} |f_k|e^{B^{1/s}\rho'|k|^{1/s}} = \|f\|_{F_{\rho}}.$$  

□

6. Renormalization

As in the previous section, $s \geq 1$ is fixed throughout and to simplify the notation we shall denote by $\|\cdot\|_{\rho}$ and $\|\cdot\|'_{\rho}$ the norms of $F_{\rho}$ and $F_{\rho'}$, respectively.

6.1. Renormalization operator. Fix $\rho > 0$. Let $w \in \mathbb{R}^{d}\{0\}$, $\sigma > 0$, $0 < \nu < \rho/(1+\beta+\beta^2)$, $\eta \in \mathbb{R}\{0\}$ and $T \in SL(d, \mathbb{Z})$. Recall also (4.4).

The renormalization operator

$$\mathcal{R}: F_{\rho'} \to \bigcup_{r > 0} F_{r}$$

is defined for each $X \in \mathcal{V}_e$ by

$$\mathcal{R}(X) = T \circ \mathcal{U}(X).$$

Proposition 6.1. Let $0 < \delta < \rho''/A^{1/s}$, $0 < \zeta < \rho''$, $\rho' = \frac{\rho'' - \zeta}{A^{1/s}} - \delta$ and $\rho'' = \frac{\rho - \nu(1+\beta+\beta^2)}{\beta^2}$.

For any $X \in \mathcal{V}_e$ we have that $\mathcal{R}(X) \in F_{\rho'}$ and

$$\|(I-E)\mathcal{R}(X)\|'_{\rho'} \leq |\eta| |T| \left(1 + \frac{s}{\delta^s}\right) \sigma^{\epsilon/2} \left[\|I_{\sigma,w}^{-}(X-w)\|_{\rho''} + 2^g |w|(C_{\nu} - 1)(2C_{\nu} - 1) |X-w|^{\rho'}\right].$$

Proof. Using Theorem 5.1, Lemma 5.3 and Lemma 4.13 we obtain the above statement. □
6.2. **Infinitely renormalizable vector fields.** For a rationally independent vector \( \omega \in \mathbb{R}^d \setminus \{0\} \) consider its multidimensional continued fractions expansion, namely the sequences \( \omega_n, T_n, \eta_n, n \geq 1 \). Moreover, consider some chosen sequences \( \rho_n, \sigma_n, \nu_n > 0 \) satisfying
\[
\sigma_n < |\omega_n| \quad \text{and} \quad \nu_n < \rho_n/(1 + \beta + \beta^2).
\]
We now define a sequence of renormalization operators \( R_n \) in the following way. Each renormalization operator is the composition of the operators \( T_n := \eta_n (T_{n-1})^s \) and \( U_n \) obtained by Theorem 5.1 for \( t = 1 \) and \( w = \omega_{n-1} \), i.e.
\[
R_n := T_n \circ U_n, \quad n \geq 1.
\]
The domain of the operator \( R_n \) is the open ball \( \mathcal{V}_{\varepsilon_{n-1}} \subset \mathcal{F}_{\rho_{n-1}}^\prime \) centered at \( \omega_{n-1} \) with radius
\[
\varepsilon_{n-1} = \varepsilon(\sigma_{n-1}, \nu_{n-1}, |\omega_{n-1}|, s, d)
\]
as given by (5.3). Notice that \( X \) and \( R_n(X) \) are Gevrey-equivalent vector fields, i.e. their flows are conjugated by an \( s \)-Gevrey diffeomorphism.

**Definition 6.1.** We say that \( X \in \mathcal{F}_\rho^\prime \) is *infinitely renormalizable* if \( X \) belongs to the domain of the operator \( R_n \circ \cdots \circ R_1 \) for every \( n \geq 1 \), i.e.
\[
\|X_{n-1} - \omega_{n-1}\|_{\rho_{n-1}} < \varepsilon_{n-1}.
\]
We will show later that infinitely renormalizable vector fields such that the renormalization converges to a constant have a flow which is linearizable by a Gevrey conjugacy. In the remaining part of this section we want to find conditions for which a vector field is infinitely renormalizable.

6.3. **Sufficient conditions.** Let \( \rho_0 := \rho \). We fix the sequence \( \nu_n := \nu > 0 \) to be constant along the iterations and so that
\[
\nu < \frac{\rho_n}{1 + \beta + \beta^2}
\]
for every \( n \geq 0 \). This can be achieved for the choice
\[
\rho_n := \frac{\rho_{n-1} - \nu(1 + \beta + \beta^2) - \beta^2 \zeta_{n-1} - \delta}{\beta^2 A_1^{1/s} \cdots A_n^{1/s}}
\]
for any sequences \( \phi_n \geq 1, \zeta_n > 0 \) and \( \delta > 0 \), as long as \( \inf_n \rho_n > 0 \). Iterating the equation above we get
\[
\rho_n = \frac{\rho - \mathcal{B}_n}{\beta^{2n} A_1^{1/s} \cdots A_n^{1/s}}
\]
where
\[
\mathcal{B}_n := \sum_{i=1}^n \beta^{2i} A_1^{1/s} \cdots A_i^{1/s} \left( \delta + \frac{\nu(1 + \beta + \beta^2)}{\beta^2 A_i^{1/s}} + \frac{\zeta_{i-1}}{A_i^{1/s}} \right)
\]
is an increasing sequence. Define
\[ \zeta_{n-1} := \frac{2 \max \left\{ \log \left( 7(d+1)|\eta_n| |T_n| \left( 1 + \frac{s^s}{\delta^s} \right) \frac{\zeta_{n-1}}{\epsilon_n} \right), 0 \right\}}{\log(1/\sigma_{n-1})} \]
where \( 0 < \theta_n \leq 1 \) is any chosen sequence.

Notice that \( B_n \) depends on the choice of the sequence \( \sigma_n \) through the sequences \( \epsilon_n \) and \( A_n \).

Moreover, if for some sequence \( \sigma_n \) we have \( \lim B_n < \infty \), then necessarily \( \beta^{2n} A_1^{1/s} \cdots A_n^{1/s} \to 0 \). Hence, if \( \rho > \lim B_n \), we have
\[ \rho_n > \frac{\rho - \lim B_n}{\beta^{2n} A_1^{1/s} \cdots A_n^{1/s}} \to +\infty \]

Let \( X_0 := X \) and \( X_n := R_n(X_{n-1}) \) whenever \( X_{n-1} \) is in the domain of \( R_n \).

**Theorem 6.2.** If \( X \in \mathcal{F}'_{\rho} \), \( 0 < \theta_n \leq 1 \) and \( 0 < \sigma_n < |\omega_n| \) satisfy
- Rot \( X = \omega \),
- \( \|X - \omega\|_{\rho_n} < \varepsilon_0 \),
- \( \rho > \lim B_n \),
then \( X \) is infinitely renormalizable and
\[ \|X_n - \omega_n\|_{\rho_n} < \varepsilon_n \theta_n, \quad n \geq 1. \quad (6.4) \]

**Proof.** If at each step \( X_n \) is in the domain of \( \mathcal{U}_{n+1} \), i.e.
\[ \|X_n - \omega_n\|_{\rho_n} < \varepsilon_n, \quad (6.5) \]
then \( X_n \) is renormalizable and \( X_{n+1} = R_{n+1}(X_n) \). Being true for any \( n \in \mathbb{N} \), then \( X \) is infinitely renormalizable. The inequality (6.5) can be estimated using [21, Proposition 3.3] and Proposition 6.1. First we get,
\[ \|X_n - \omega_n\|_{\rho_n} = \| R_n(X_{n-1}) - \omega_n \|_{\rho_n} \]
\[ \leq \|(I - \mathcal{E}) R_n(X_{n-1})\|_{\rho_n} + \|\mathcal{E} R_n(X_{n-1}) - \omega_n\| \]
\[ \leq (d+1)\|(I - \mathcal{E}) R_n(X_{n-1})\|_{\rho_n}. \quad (6.6) \]

Thus,
\[ \|X_n - \omega_n\|_{\rho_n} \leq (d+1)|\eta_n| |T_n| \left( 1 + \frac{s^s}{\delta^s} \right) \sigma^\xi_{n-1/2} \left[ \| \Pi_{n-1}^+(X_{n-1} - \omega_{n-1})\|_{\xi'} + \frac{2^p|\omega_{n-1}|(C_{\nu} - 1)(2C_{\nu} - 1)}{\sigma^2_{n-1}} \|X_{n-1} - \omega_{n-1}\|_{\xi}^2 \right], \]
where
\[ \xi' = A_n^{1/s} (\rho_n + \delta) + \zeta_{n-1} \quad \text{and} \quad \xi = \beta^2 \xi' + \nu \left( 1 + \beta + \beta^2 \right). \]
We now proceed by induction. Assuming that (6.4) holds for \( n - 1 \), we substitute the value of \( \zeta_{n-1} \) and use Remark 5.2 to get,

\[
\|X_n - \omega_n\|'_{\rho_n} \leq 7(d + 1)|\eta_n| |T_n| \left( 1 + \frac{s^s}{\delta} \right) \sigma_{\zeta_{n-1}/2} X_n - \omega_{n-1}\|'_\xi
\]

\[< \varepsilon_n \theta_n. \]

7. Conjugacy to torus translation

In this section we give a sufficient condition for a conjugacy of the flow of \( X \) to a torus translation to have Gevrey regularity.

7.1. Convergence of the conjugation. Fix \( s \geq 1 \) and let \( \rho > 0 \). Assume that \( X \) is infinitely renormalizable, i.e.

\[
\|X_n - \omega_n\|_{F_{\rho_n}} \leq \varepsilon_n, \quad n \geq 1.
\]

Notice that

\[
X_n = \lambda_n (U_1 \circ T_1^{-1} \circ \cdots \circ U_n \circ T_n^{-1})^*(X) \in F'_{\rho_n}, \quad (7.1)
\]

with \( U_n := \text{Id} + \Omega_n(X_{n-1}) \in F'_{\rho_{n-1}} \) and \( \lim \rho_n = \infty \). Furthermore, we can write

\[
P_n^X = \lambda_n h_n^*(X) \quad (7.2)
\]

by considering the \( s \)-Gevrey diffeomorphisms

\[
h_n := g_1 \circ \cdots \circ g_n \quad (7.3)
\]

and

\[
g_n := P_{n-1}^{-1} \circ U_n \circ P_{n-1}, \quad n \geq 1.
\]

For convenience of notations, set \( T_0 = P_0 = I \) to be the identity matrix. Notice that \(|I| = 1\).

Define,

\[
r_n := \frac{\rho_{n-1} - \nu}{2 \beta^2 B_{n-1}^{1/s}}, \quad n \geq 1.
\]

We recall that \( 0 < \nu < \rho_n/(1 + \beta + \beta^2) \).

Lemma 7.1. For every \( n \geq 1 \),

\[
\|g_n - \text{Id}\|_{c_{r_n}} \leq 8(C_\nu - 1) \frac{|P_{n-1}|}{\sigma_{n-1}} \|\Pi_{n-1} X_{n-1}\|_{F_{\rho_{n-1}}}. \quad (7.4)
\]

Proof. Lemma 4.10, Lemma 5.4 and Theorem 5.1 imply that

\[
\|P_{n-1}^{-1} \circ U_n \circ P_{n-1}\|_{c_{r_n}} \leq |P_{n-1}^{-1}| \|U_n \circ P_{n-1}\|_{F_{\rho_{n-1}, r_n}}
\]

\[\leq |P_{n-1}^{-1}| \|U_n\|_{F_{r_n}}
\]

\[\leq \frac{8(C_\nu - 1) |P_{n-1}|}{\sigma_{n-1}} \|\Pi_{n-1} X_{n-1}\|_{F_{\rho_{n-1}}},
\]
where
\[ \varsigma_n = B^{1/s}_{n-1}(\beta r_n + \mu_n) \quad \text{and} \quad \mu_n = \frac{\rho_n - \nu}{2B^{1/s}_{n-1}}. \]

Given \( \ell \in \mathbb{N}_0 \), denote by \( C^\ell(\mathbb{T}^d, \mathbb{R}^d) \) the space of \( 2\pi \mathbb{Z}^d \)-periodic functions which have \( \ell \) continuous derivatives. We consider the \( C^\ell \)-norm,
\[ \|f\|_{C^\ell} := \sup_{|\alpha| \leq \ell} \|\partial^\alpha f\|_{C^0}. \]

Also define,
\[ \Theta_n := \frac{|P^{-1}_{n-1}|}{\sigma_{n-1}} \|X_{n-1} - \omega_{n-1}\|_{F_{\rho_{n-1}}}. \]

From now on we consider a sequence of positive real numbers \( \{R_n\}_{n \geq 0} \) satisfying,
\[ R_n \leq r_n \quad \text{and} \quad d^{\frac{s-1}{s}}R_n < R_{n-1}, \quad n \geq 1. \quad (7.5) \]

**Theorem 7.2** (Topological conjugacy). If
\[ \sum_{n=1}^{\infty} \frac{\Theta_n}{(R_{n-1} - d^{\frac{s-1}{s}}R_n)^s} < \infty, \]
then \( h = \lim_n h_n \) is a homeomorphism and \( \phi^t_X \circ h = h \circ \phi^t_\omega. \)

**Proof.** Notice that, by Lemma A.1,
\[ \frac{(R_{n-1} + d^{\frac{s-1}{s}}R_n)^s}{2^s d^{s-1}} - R_n^s \geq \left( \frac{R_{n-1} - d^{\frac{s-1}{s}}R_n}{2^s d^{s-1}} \right)^s. \]

The convergence of the series in the hypothesis implies that
\[ \lim_n \Theta_n/(R_{n-1} - d^{(s-1)/s}R_n)^s = 0. \]

Thus, for \( n \) sufficiently large we have
\[ \frac{8(C_\nu - 1)|P^{-1}_{n-1}|}{\sigma_{n-1}} \|X_{n-1}\|_{F_{\rho_{n-1}}} \leq \frac{(R_{n-1} + d^{\frac{s-1}{s}}R_n)^s}{2^s d^{s-1}} - R_n^s. \quad (7.6) \]

This condition is sufficient to apply Lemma 4.6. So we get,
\[ \|h_n - h_{n-1}\|_{C^{R_n}} \leq \frac{\Gamma_n}{(R_{n-1} - d^{\frac{s-1}{s}}R_n)^s} \|g_n - \text{Id}\|_{C^{R_n}}, \]

where
\[ \Gamma_n := (R_{n-1} - d^{\frac{s-1}{s}}R_n)^s + 2^s \sum_{i=1}^{n-1} \|g_i - \text{Id}\|_{C^{R_i}}. \]

Follows from Lemma 7.1, the properties of \( R_n \) and \( \sum_n \Theta_n < \infty \) that \( \Gamma := \sup_n \Gamma_n < \infty. \) So,
\[ \|h_n - h_{n-1}\|_{C^{R_n}} \leq \frac{\Gamma}{(R_{n-1} - d^{\frac{s-1}{s}}R_n)^s} \|g_n - \text{Id}\|_{C^{R_n}}. \]
Using again Lemma 7.1, we have
\[ \|h_n - h_{n-1}\|_{C_{\mathbb{R}^n}} \leq 8(C_\nu - 1)\Gamma \frac{\Theta_n}{(R_{n-1} - d^{-\frac{1}{s}}R_n)^s}. \quad (7.7) \]
Noticed that \( \|h_n - h_{n-1}\|_{C^0} \leq \|h_n - h_{n-1}\|_{C_{\mathbb{R}^n}} \). Thus, \( h_n - \text{Id} \) is a Cauchy sequence in \( C^0 \). Hence, it converges to \( h - \text{Id} \in C^0(\mathbb{T}^d, \mathbb{R}^d) \) where \( h := \lim_n h_n \). To show that \( h \) is a homeomorphism we prove that the inverse \( h_n^{-1} \) also converges in \( C^0 \). Notice that,
\[ \|h_n^{-1} - h_{n-1}^{-1}\|_{C^0} = \|g_n^{-1} - \text{Id}\|_{C^0}, \]
and
\[ \|g_n^{-1} - \text{Id}\|_{C^0} = \|(g_n - \text{Id}) \circ g_n^{-1}\|_{C^0} = \|g_n - \text{Id}\|_{C^0}. \]

It follows immediately that \( h_n^{-1} \) converges in \( C^0 \). Thus \( h \) is a homeomorphism.

Finally, we show that \( h \) conjugates the flow of \( X \) to a linear flow with frequency \( \omega \). First notice that
\[ \phi_t^X \circ h_n = h_n \circ \phi_t^{X_n}. \]
Since \( \lambda_n^{-1}P_n^*X_n = \omega + \lambda_n^{-1}P_n^*(X_n - \omega_n) \) we get,
\[ \left\| \phi_t^{X_n} - \phi_t^X \right\|_{C^0} \leq \left\| \int_0^t \lambda_n^{-1}P_n^*(X_n - \omega_n) \circ \phi_s^{X_n} ds \right\|_{C^0} \]
\[ \leq |t| \lambda_n^{-1} |P_n^{-1}| \|X_n - \omega_n\|_{C^0} \]
\[ = |t| \sigma_n \lambda_n^{-1} \Theta_{n+1} \]
\[ \leq |t| \|\omega_n\| \lambda_n^{-1} \Theta_{n+1}. \]

Since \( \sigma_n < |\omega_n| \) by definition of the sequence \( \sigma_n \) (see Theorem 5.1) and \( |\omega_n| \leq C_1|\omega|\lambda_n \) by Lemma 3.8, the time-\( t \) map \( \phi_t^{X_n} \) converges to \( \phi_t^X \) in the \( C^0 \)-topology for every \( t \in \mathbb{R} \). \( \square \)

**Theorem 7.3** (\( C^\ell \) conjugacy). If there exists \( \ell \in \mathbb{N} \), \( \eta > 0 \) and \( C > 0 \) such that,
\[ \sum_{n=1}^{\infty} \frac{\Theta_n}{(R_{n-1} - d^{-\frac{1}{s}}R_n)^s R_n^{s\ell}} \leq C \eta^s, \]
then \( h := \lim_n h_n \) is a \( C^\ell \) diffeomorphism and moreover
\[ \|\partial^\alpha(h - \text{Id})\|_{C^0} \leq C' \alpha! \eta^{2s\ell}, \quad |\alpha| = \ell \quad (7.8) \]
where \( C' > 0 \) is independent of \( \ell \).

**Proof.** Define
\[ D_n := \frac{\Theta_n}{(R_{n-1} - d^{-\frac{1}{s}}R_n)^s R_n^{s\ell}}. \]
By hypothesis, there exists $\ell \in \mathbb{N}$ such that $\sum_n D_n < \infty$. From the definition of the $C_{R_n}$-norm we have for each $\alpha \in \mathbb{N}^d$ that

$$\| \partial^\alpha (h_n - h_{n-1}) \|_{C^0} \leq \frac{\alpha! s}{R_n} \| h_n - h_{n-1} \|_{C_{R_n}}.$$ 

So, by (7.7) we get

$$\| \partial^\alpha (h_n - h_{n-1}) \|_{C^0} \leq 8(C'_\nu - 1) \Gamma \alpha! s D_n,$$

where $\Gamma = \sup_n \Gamma_n$ and $\Gamma_n := (R_{n-1} - d^{i-1} s R_n)^s + 2^s \sum_{i=1}^{n-1} \| g_i - \text{Id} \|_{C_{R_i}}$.

By the hypothesis of the theorem we conclude that $\Gamma \leq C'_\eta s \ell$ for some constant $C'_\eta > 0$ independent of $\ell$. Since $\sum_n D_n < \infty$, the sequence $h_n - \text{Id}$ is Cauchy in $C^0(\mathbb{T}^d, \mathbb{R}^d)$. Thus, $h - \text{Id} \in C^0(\mathbb{T}^d, \mathbb{R}^d)$ where $h := \lim_n h_n$. Taking in consideration Lemmas 4.5 and 4.6 we obtain, for any $m \geq 1$ sufficiently large, that,

$$\| g_m \circ \cdots \circ g_n - \text{Id} \|_{C_{R_n}} \leq \sum_{i=m}^{n} \| g_i - \text{Id} \|_{C_{R_i}}, \quad n \geq m.$$ 

In view of Lemma 7.1 and $\sum_n \Theta_n < \infty$, the previous estimate gives $\| h - \text{Id} \|_{C^1} < 1$. Thus, $h$ is a diffeomorphism. Let $|\alpha| = \ell$. To get the final estimate we write using a telescopic argument,

$$\| \partial^\alpha (h_n - \text{Id}) \|_{C^0} \leq \sum_{i=1}^{n} \| \partial^\alpha (h_i - h_{i-1}) \|_{C^0} \leq 8(C'_\nu - 1) \Gamma \alpha! s \sum_{i=1}^{n} D_i \leq 8(C'_\nu - 1) C' \alpha! s \eta^{2s \ell},$$

where we have assumed for convenience $h_0 = \text{Id}$. 

7.2. **Sufficient conditions.** Define $R_0 := \rho_0 - \lim B_n$, recalling (6.3), and

$$R_n := \frac{1}{2} \min \left\{ \frac{R_0}{\beta n \Omega_n^{1/s} d^{-1}}, \frac{R_{n-1}}{R_n - 1} \right\}, \quad n \geq 1,$$

where,

$$\Omega_n := \max_{1 \leq i \leq n} A_i \cdots A_{i-1} B_{i-1}.$$ 

Notice that $\Omega_n \leq \Omega_n + 1$. For convenience we set $\Omega_0 = 1$.

**Lemma 7.4.** For every $n \geq 1$, (7.5) holds and

$$\frac{R_0}{2n \beta n \Omega_n^{1/s}} \leq R_n \leq \frac{R_0}{2 \beta n \Omega_n^{1/s}}.$$
Proof. Using (6.2) we see that
\[ \rho_{n-1} - \nu > \frac{\rho_0 - \lim B_n}{\beta^{2(n-1)} A_1^{1/s} \cdots A_{n-1}^{1/s}}. \]

Hence,
\[ r_n = \frac{\rho_{n-1} - \nu}{2\beta^2 B_{n-1}^{1/s}} > \frac{R_0}{2\beta^2 A_1^{1/s} \cdots A_{n-1}^{1/s} B_{n-1}^{1/s}} \geq R_n. \]

This shows the first inequality in (7.5). The other one is immediate from the definition of \( R_n \).

Finally, the last inequalities follow by induction on \( n \). \( \square \)

In the following we give a sufficient condition for the conjugacy \( h \) to have \( C_\ell \)-smooth regularity in terms of the growth of an increasing sequence \( t_n \) starting at \( t_0 = 0 \). Recall that \( W_n = W(t_n) \) and \( \Delta_n = \tau_{kn} - W(\tau_{kn}) \) (see section 3). Define
\[ \sigma_n := n^{-1} C_1^{-1} e^{-(d-1)(t_{n+1} - t_n) - (d-1)W_n - t_{n+1} + \Delta_n}. \] (7.9)

**Proposition 7.5.** Let \( \ell \in \mathbb{N} \). If \( t_1 > \frac{1}{d} \log((2\beta^2)^s C_2) \) and
\[ t_{n+1} \geq 5(\ell + 1)t_n, \quad n \geq 1, \]
then there are constants \( C, \eta > 0 \) not depending on \( \ell \) such that (7.8) holds.

**Proof.** By Lemma 7.4
\[ (R_{n-1} - d^{\frac{1}{s}} R_n)^s > \frac{R_n^s}{2^s}, \quad \forall n \geq 1. \]

Moreover, from the definition of \( \Theta_n \) and \( \varepsilon_n \) (see Theorem 5.1) we have that,
\[ \Theta_n \leq \frac{|P_{n-1}^{-1}|}{\sigma_n^{-1}} \leq \frac{|P_{n-1}^{-1}| \sigma_{n-1}}{C_\nu - 1}, \quad \forall n \geq 1. \]

Thus, by Lemma 7.4,
\[ \frac{\Theta_n}{(R_{n-1} - d^{\frac{1}{s}} R_n)^s R_n^\ell} \leq \frac{2^s \Theta_n}{R_n^{s(\ell+1)}} \leq \frac{2^s |P_{n-1}^{-1}| \sigma_{n-1}}{(C_\nu - 1) R_n^{s(\ell+1)}} \leq c_1 (2\beta^2)^{ns(\ell+1)} \Omega_n^{\ell+1} |P_{n-1}^{-1}| \sigma_{n-1}, \]

where
\[ c_1 := \frac{2^s}{(C_\nu - 1) R_0^{s(\ell+1)}}. \]

By Lemma 3.11,
\[ \Omega_n \leq |\omega| C_1 C_2^{m-1} \left( 1 + \frac{1}{n - 1} \right)^{n-1} e^{(d+1)t_{n-1}}. \]
Notice that
\[ \sigma_n \leq C_1^{-1} e^{-(t_{n+1} - t_n)}. \]
Moreover, by Lemma 3.8 and the definition of \( \sigma_n \),
\[ |P_{n-1}^{-1}\sigma_{n-1}| \leq C_1^{-1} C_2|\omega| e^{(d-1)(t_{n-1} - W_{n-1}) + dW_{n-1, t_{n-1}}} \leq C_1^{-1} C_2|\omega| e^{-dt_{n+2}dt_{n-1}}. \]
Putting these estimates together we get
\[ \Omega_{n+1} \left| P_{n-1}^{-1}\sigma_{n-1} \right| \leq e^{\ell+1} (C_1 C_2^{-1})^\ell |\omega|^{\ell+2} C_2^n e^{-dt_{n+4d(\ell+1)}t_{n-1}}. \]
Thus,
\[ \Theta_n \left( R_{n-1} - \frac{dt_{n+1}}{\ell+1} R_n \right)^s R_n^s \leq c_2 a_n \]
where
\[ c_2 := c_1 e^{\ell+1} (C_1 C_2^{-1})^{\ell+2} \]
and
\[ a_n := (2\beta^2 C_2^n)^{n(\ell+1)} e^{-d(t_{n+4(\ell+1)}t_{n-1})}. \]
In particular, \( a_1 = b^{\ell+1} e^{-dt_1} \) where \( b := (2\beta^2 C_2) \).
By the hypothesis on \( t_n \) we conclude that for \( n \geq 2 \),
\[ a_n \leq e^{-(\ell+1)t_{n-1} + n(\ell+1)\log b} \]
with \( a_2 \leq (b^2 e^{-dt_1})^{\ell+1} \) and
\[ t_n \geq t_1 (5(\ell + 1))^{n-1} \geq t_1 (n + 1). \]
Hence, for \( n \geq 3 \),
\[ a_n \leq e^{-(\ell+1)(d_{n-1} - n \log b)} \leq e^{-(\ell+1)(d_1 - \log b)n} \]
and
\[ \sum_{n=3}^{\infty} \frac{\Theta_n}{(R_{n-1} - \frac{dt_{n+1}}{\ell+1} R_n)^s R_n^s} \leq c_2 \sum_{n=3}^{\infty} a_n \leq c_2 \sum_{n=3}^{\infty} e^{-((\ell+1)(d_{n-1} - n \log b)n} \leq c_2 e^{-(\ell+1)(d_1 - \log b)\beta} \leq \frac{c_2 e^{-(\ell+1)(d_1 - \log b)\beta}}{1 - e^{-(\ell+1)(d_1 - \log b)}}. \]
\[ \square \]
7.3. Class of frequency vectors. Recall that the numbers $A_n$, $\eta_n$ and $|T_n|$ depend on the choice of a strictly increasing unbounded sequence $t_n$.

Lemma 7.6. If

$$\sum_{n=0}^{\infty} (\beta^2 C_2^{1/2})^n e^{-\frac{1}{2} \Delta(t_n)} t_{n+1} < \infty, \quad (7.10)$$

then $\lim B_n < \infty$.

Proof. It follows from the definition of $\varepsilon_n$ (see (5.3)) that

$$\frac{\varepsilon_{n-1}}{\varepsilon_n} = \left( \frac{\sigma_{n-1}}{\sigma_n} \right)^2,$$

for every $n \geq 1$ sufficiently large. Moreover, from the definition of sequences $\sigma_n$ and $\theta_n = 1$ we have that

$$\log \left( \frac{\varepsilon_{n-1}}{\varepsilon_n \theta_n} \right) \leq 2 dt_{n+1} + \log \theta_n^{-1} + 2 \log \left( \frac{n}{n-1} \right) \leq c_0 t_{n+1},$$

for every $n$ sufficiently large and some constant $c_0 > 0$ independent of $n$. Moreover, by Lemma 3.8,

$$\log (|\eta_n||T_n|) \leq \log (C_1 C_2) + 2 dt_n.$$

Hence,

$$\log \phi_n \leq c_1 t_{n+1},$$

for every $n$ sufficiently large and some constant $c_1 > 0$ independent of $n$. Now the claim follows since by Lemma 3.11, we have that

$$A_1^{1/s} \cdots A_n^{1/s} \leq (1 + 1/n)^{\frac{s}{2}} C_2^{\frac{n}{s}} e^{-\frac{1}{2} \Delta(t_n)} \leq c_2 C_2^{\frac{n}{s}} e^{-\frac{1}{2} \Delta(t_n)},$$

for some constant $c_2 > 0$ independent of $n$. 

7.4. Gevrey conjugation. The following theorem is the main result of this paper.

Theorem 7.7. Let $X \in \mathcal{F}_{\rho_0}$ be an $s$-Gevrey vector field such that $\text{Rot} \ X = \omega = (\alpha, 1)$ is an $s(1 + \delta)$-Brjuno vector with $\delta > 0$. There is $\varepsilon_0 = \varepsilon_0(\rho_0, \omega, s, d) > 0$ such that if $\|X - \omega\|'_{\rho_0} < \varepsilon_0$, then there exists an $s$-Gevrey diffeomorphism $h$ such that $\phi^t_X \circ h = h \circ \phi^t_\omega$.

Proof. By assumption, $\sum_{n>0} e^{-\frac{1}{s(1+\delta)} \Delta(t_n)} t_{n+1} < \infty$ where $\{\tau_n\}_{n>0}$ is the stopping time sequence associated with $\omega$. Now define the following modified sequence. Let $t_0 = \tau_0 = 0$,

$$t_1 = \max \left\{ \frac{1}{d} \log((2\beta^2)^s C_2) + \xi, \tau_1 \right\}$$

for a given $\xi > 0$ and

$$t_{n+1} = \max \{5(\ell + 1)t_n, \tau_{n+1} \}, \quad n \geq 1,$$
where ℓ ∈ \mathbb{N}. Notice that \( t_n \geq \tau_n \) for every \( n \geq 0 \) and the sequence \( \{t_n\}_{n \geq 0} \) satisfies the assumption of Proposition 7.5. Choose \( \ell \in \mathbb{N} \) such that \( 5(\ell + 1) \geq (\beta^2 C_2^{1/s})^{1/\delta} \). Then \((\beta^2 C_2^{1/s})^n / t_{n+1}^{\delta} \leq 1 / \tau_1^d \) for every \( n \geq 0 \).

For each \( n \geq 1 \) there are two cases: if \( t_{n+1} = \tau_{n+1} \), we have
\[
e^{-\frac{1}{\tau_1} \Delta(t_n)} t_{n+1} \leq e^{-\frac{1}{\tau_1} \Delta(\tau_n)} \tau_{n+1},
\]
since \( \Delta(\tau_n) \leq \Delta(t_n) \); otherwise \( t_{n+1} = 5(\ell + 1) t_n \) and we have
\[
e^{-\frac{1}{\tau_1} \Delta(t_n)} t_{n+1} = 5(\ell + 1) e^{-\frac{1}{\tau_1} \Delta(t_n)} t_n.
\]
We conclude that
\[
\sum_{n=0}^{\infty} e^{-\frac{1}{\tau_1} \Delta(t_n)} t_{n+1} \leq \sum_{n=0}^{\infty} e^{-\frac{1}{\tau_1} \Delta(t_n)} \tau_{n+1} + 5(\ell + 1) \sum_{n=0}^{\infty} e^{-\frac{1}{\tau_1} \Delta(t_n)} t_n.
\]
Since \( \frac{t_{n+1}}{t_n} \geq 5(\ell + 1) > 1 \), we get by Proposition 3.7,
\[
\sum_{n=0}^{\infty} e^{-\frac{1}{\tau_1} \Delta(t_n)} t_{n+1} < \infty.
\]
Furthermore,
\[
\sum_{n=0}^{\infty} (\beta^2 C_2^{1/s})^n e^{-\frac{1}{\tau_1} \Delta(t_n)} t_{n+1} = \sum_{n=0}^{\infty} (\beta^2 C_2^{1/s})^n e^{-\frac{1}{\tau_1} \Delta(t_n)} t_{n+1}^{1+\delta}
\leq \frac{1}{\tau_1^d} \sum_{n=0}^{\infty} e^{-\frac{1}{\tau_1} \Delta(t_n)} t_{n+1}^{1+\delta}
\leq \frac{1}{\tau_1^d} \left( \sum_{n=0}^{\infty} e^{-\frac{1}{\tau_1} \Delta(t_n)} t_{n+1} \right)^{1+\delta}
\]
\[
< \infty.
\]
So, both the hypothesis of Lemma 7.6, Theorem 6.2 and Proposition 7.5 hold for the chosen modified sequence \( t_n \).

Now, denote by \( \mathcal{B}(\omega) \) the limit of \( \mathcal{B}_n \) for a vector \( \omega \). As in [21, Theorem 8.1] we can iterate the renormalization operator a finite number of steps \( N \geq 1 \) to get \( \rho_N > \mathcal{B}(\omega_N) \). Therefore, we assume from the very beginning that \( \rho_0 > \mathcal{B}(\omega) \). Notice that \( \mathcal{B}(\omega) < \infty \) by Lemma 7.6. We now apply Theorem 6.2 with \( \sigma_n \) defined in (7.9) and \( \theta_n = 1 \) to conclude that \( X \) is infinitely renormalizable. The value of \( \varepsilon_0 \) is given by (5.3). By Theorem 7.2 and Theorem 7.3, the vector field \( X \) is \( C^\ell \) conjugated to the constant vector field \( \omega \). The conjugacy \( h \) has \( s \)-Gevrey estimates (7.8). Since \( \ell \in \mathbb{N} \) is arbitrary and the conjugacy \( h \) is unique up to a composition with a translation, we conclude that \( h \) is \( s \)-Gevrey smooth. \( \square \)
A.1. Useful inequalities.

**Lemma A.1.** Let \( a_n \geq 0, \, n \in \mathbb{N}, \) and \( s \geq 1. \) Then,

(1) \[
\sum_{i=1}^{\infty} a_i^s \leq \left( \sum_{i=1}^{\infty} a_i \right)^s \tag{A.1}
\]

(2) \[
\sum_{i=1}^{d} a_i^{1/s} \leq d^{(s-1)/s} \left( \sum_{i=1}^{d} a_i \right)^{1/s} \tag{A.2}
\]

**Proof.**

(1) Assume that \( 0 < \sum_{i=1}^{\infty} a_i < \infty \) (the remaining cases are immediate). Thus,

\[
\sum_{j=1}^{\infty} \left( \frac{a_j}{\sum_{i=1}^{\infty} a_i} \right)^s \leq \sum_{j=1}^{\infty} \frac{a_j}{\sum_{i=1}^{\infty} a_i} = 1.
\]

(2) By the convexity of the function \( x \mapsto x^s, \)

\[
\left( \frac{b_1 + \cdots + b_d}{d} \right)^s \leq \frac{b_1^s + \cdots + b_d^s}{d}.
\]

Now set \( b_i = a_i^{1/s}. \) \( \square \)

A.2. **Proof of Theorem 5.1.** Define

\[
d = \frac{8(C_{\nu} - 1)}{\sigma} \varepsilon < \frac{1}{2}.
\]

Let \( X = w + f \) where \( f \in \mathcal{F}_{\rho}. \) We seek a coordinate transformation \( U = \text{Id} + u \) where \( u \) belongs to

\[
\mathcal{B}_\delta = \{ u \in \mathbb{I}_\sigma \mathcal{F}_{\rho'} : \| u \|^s_{\rho'} < \delta \}.
\]

Notice that

\[
U^* X = (I + Du)^{-1}(w + f \circ (\text{Id} + u)).
\]

Since

\[
\left( \frac{\rho' + d^{s-1}}{2s} (\rho'' + \nu) \right)^s - (\rho'' + \nu)^s \geq \frac{1}{\beta^s} \left( \left( \frac{\rho' - \nu}{2} \right)^s - (\rho' - \nu)^s \right)
\]

and \( \delta \leq \frac{\nu'}{(2\beta)^s}, \) Proposition 4.12 implies that we have a well defined operator \( \mathcal{G} : \mathcal{B}_\delta \rightarrow \mathbb{I}_\sigma \mathcal{F}_{\rho'} \) given by,

\[
\mathcal{G}(u) := \mathbb{I}_\sigma (I + Du)^{-1}(w + f \circ (\text{Id} + u)).
\]
Notice that, \( \mathcal{G}(0) = I - \sigma X \in I^{-1}_\sigma F'_\rho \).

We want to find \( u \in B_\delta \) such that \( \mathcal{G}(u) = 0 \). We solve this problem using a homotopy, i.e. we will look for a smooth family \( u_t : [0, 1] \to B_\delta \) satisfying the equation,

\[
\mathcal{G}(u_t) = (1 - t) \mathcal{G}(0).
\]

Differentiating with respect to \( t \) we conclude that \( u_t \) has to satisfy the differential equation

\[
DG(u_t) \frac{du_t}{dt} = -\mathcal{G}(0).
\]

In order to solve this differential equation we invert \( DG(u_t) \). The following lemmas provide the necessary estimates.

**Lemma A.2.** If \( u \in B_\delta \), then the derivative of \( \mathcal{G} \) at \( u \) is a linear operator \( DG(u) : I^{-1}_\sigma F'_\rho \to I^{-1}_\sigma F''_\rho \) defined by

\[
\begin{align*}
  h \mapsto & \ I^{-1}_\sigma \bigl( (I + Du)^{-1} \bigl( (Df) \circ Uh - Dh(I + Du)^{-1}(w + f \circ U) \bigr) \bigr) .
\end{align*}
\]

(A.3)

**Proof.** See [19, Lemma 9.2] for the computation of the derivative. To see that \( DG(u)h \in I^{-1}_\sigma F''_\rho \) for any \( h \in I^{-1}_\sigma F'_\rho \) just apply Proposition 4.12.

□

**Lemma A.3.** If \( \|f\|_\rho' < \varepsilon \), then \( DG(0) \) is a bounded linear operator from \( I^{-1}_\sigma F'_\rho \) to \( I^{-1}_\sigma F''_\rho \). Moreover

\[
\|DG(0)^{-1}\| < \frac{4(C_\nu - 1)}{\sigma}.
\]

**Proof.** Let \( L_fh = Df \circ h - Dh \circ f \) and \( D_wh = Dh \circ w \). Then

\[
DG(0)h = I^{-1}_\sigma (L_f - D_w)h.
\]

We wish to invert \( DG(0) \) on \( I^{-1}_\sigma F_\rho \), i.e. on elements in \( F_\rho \) having only far from resonant modes. Formally,

\[
DG(0)^{-1} = (I^{-1}_\sigma (L_f - D_w))^{-1} = D_w^{-1}(I^{-1}_\sigma L_f D_w^{-1} - I)^{-1}.
\]

The inverse of \( D_w \) is a bounded linear operator from \( I^{-1}_\sigma F_\rho \) to \( I^{-1}_\sigma F'_\rho \). Indeed, given \( g \in I^{-1}_\sigma F_\rho \),

\[
\| (D_w)^{-1} g \|_{\rho'} = \sum_{k \in I_\sigma} \frac{1 + |k|}{|k \cdot w|} |g_k| e^{\rho' |k|^{1/s}}
\leq \sum_{k \in I_\sigma} \frac{1 + |k|}{\sigma |k|} |g_k| e^{(\rho - \nu) |k|^{1/s}}
\leq \frac{2(C_\nu - 1)}{\sigma} \|g\|_\rho .
\]

Moreover, \( L_fh \) is a bounded linear operator from \( I^{-1}_\sigma F'_\rho \) to \( F'_\rho \),

\[
\| L_fh \|_{\rho'} \leq \| Df \circ h \|_{\rho'} + \| Dh f \|_{\rho'} \leq 2\|f\|_{\rho'} \|h\|_{\rho'} .
\]
Thus,
\[ \|\mathcal{L}_f D_w^{-1}\| \leq \frac{4(C\nu - 1)}{\sigma} \|f\|_{\rho'} < \frac{1}{2}, \]
since \( \|f\|_{\rho'} < \varepsilon < \frac{\sigma}{8(C\nu - 1)}. \) Hence,
\[ \|DG(0)^{-1}\| \leq \frac{\|D_w^{-1}\|}{1 - \|\mathcal{L}_f D_w^{-1}\|} < \frac{4(C\nu - 1)}{\sigma}. \]

\[ \square \]

**Lemma A.4.** If \( u \in \mathcal{B}_\delta \) and \( \|f\|_{\rho'} < \varepsilon, \) then the linear operator \( DG(u) - DG(0) \) mapping \( \mathcal{F}_{\rho'}^- \) to \( \mathcal{F}_{\rho''}^- \) is bounded and
\[ \|DG(u) - DG(0)\| < \frac{\delta|w|C\nu}{C\nu - 1} \left( \frac{2^s}{\nu^s} + 7 \right) \]

**Proof.** According to (A.3) we can write
\[ (DG(u) - DG(0)) h = \mathcal{L}_f (I + Du)^{-1} (A_1 + A_2 + A_3), \]
where
\[ A_1 = (Df \circ (Id + u) - Df - Du Df) h, \]
\[ A_2 = Du Dh(w + f), \]
\[ A_3 = -Dh(I + Du)^{-1} (f \circ (Id + u) - f - Du(w + f)). \]
It follows from Proposition 4.12 that,
\[ \|A_1\|_{\rho''} \leq \left( \frac{2^s C\nu}{\nu^s} + 1 \right) \|f\|_{\rho'} \|u\|_{\rho'} \|h\|_{\rho'}, \]
\[ \|A_2\|_{\rho''} \leq (|w| + \|f\|_{\rho'}) \|u\|_{\rho'} \|h\|_{\rho'}, \]
\[ \|A_3\|_{\rho''} \leq \frac{\|u\|_{\rho'}}{1 - \|u\|_{\rho'}} \left[ |w| + (1 + C\nu) \|f\|_{\rho'} \|h\|_{\rho'} \right]. \]
Taking into account that \( \|u\|_{\rho'} < \delta < 1/2, \|f\|_{\rho'} < \varepsilon < \frac{\sigma}{8(C\nu - 1)} \) and \( 0 < \sigma < |w| \) we get,
\[ \|DG(u) - DG(0)\| < \frac{|w| \delta C\nu}{4(C\nu - 1)} \left( \frac{2^s}{\nu^s} + 26 \right) \]
which gives the final estimate. \( \square \)

**Lemma A.5.** If \( u \in \mathcal{B}_\delta \) and \( \|f\|_{\rho'} < \varepsilon, \) then \( DG(u)^{-1} \) is a bounded linear operator from \( \mathcal{F}_\rho^- \) to \( \mathcal{F}_{\rho''}^- \). Moreover,
\[ \|DG(u)^{-1}\| < \frac{\delta}{\varepsilon}. \]

**Proof.** Notice that,
\[ DG(u)^{-1} = (DG(u) - DG(0) + DG(0))^{-1} = DG(0)^{-1} [I + (DG(u) - DG(0)) DG(0)^{-1}]^{-1}. \]
By Lemmas A.3 and A.4,
\[
\|DG(u) - DG(0)\|\|D^{-1}G(0)\| < \frac{4\delta|w|C_\nu}{\sigma}\left(\frac{2^s}{\nu^s} + 7\right) < \frac{1}{2},
\]
by our choice of \(\delta\). Thus, again using Lemma A.3
\[
\|D^{-1}G(u)\| < 2\|D^{-1}G(0)\| < \frac{8(C_\nu - 1)}{\sigma} = \frac{\delta}{\varepsilon}.\]
\[\Box\]

Now we conclude the proof of Theorem 5.1. Notice that,
\[
u_t = -\int_0^t DG(u_s)^{-1}G(0) \, ds.
\]
Since \(G(0) \in \mathcal{I}^{-\sigma}_\rho\), it follows from Lemma A.5 that,
\[
\|\nu_t\|_\rho' \leq t \sup_{u \in \mathcal{B}_\delta} \|DG(u)^{-1}\| \|G(0)\|_\rho < \frac{8t(C_\nu - 1)}{\sigma} \|\mathcal{I}^{-\sigma}_\rho X\|_\rho. \quad (A.4)
\]
This implies that \(u_t \in \mathcal{B}_\delta\) for every \(t \in [0,1]\). So \(X \mapsto u_t\) defines an operator \(\mathcal{U}_t\) from \(V_\epsilon\) to \(\mathcal{I}^{-\sigma}_\rho\) and \(X \mapsto (\text{Id} + \mathcal{U}_t(X))^*X\) defines another operator \(\mathcal{U}_t\) from \(V_\epsilon\) to \((1 - t)\mathcal{I}^{-\sigma}_\rho \oplus t\mathcal{I}^+_{\sigma}\rho'\). In addition,
\[
\mathcal{U}_t(w + f) - w = \mathcal{I}^+_{\sigma}f + (1 - t)\mathcal{I}^{-\sigma}_\rho f + \mathcal{I}^+_{\sigma}(A_1 + A_2 + A_3)
\]
where
\[
A_1 = D fu_t - Du_t f - Du_t Df u_t,
A_2 = (I - Du_t)(f \circ (\text{Id} + u_t) - f - Df u_t),
A_3 = \sum_{n=2}^\infty (-Du_t)^n (w + f \circ (\text{Id} + u_t)).
\]
Using (A.4) and Proposition 4.12 we get,
\[
\|A_1\|_{\rho'} \leq \frac{24t(C_\nu - 1)}{\sigma} \|f\|_\rho'^2,
\|A_2\|_{\rho'} \leq \frac{32tC_\nu(C_\nu - 1)}{\sigma} \|f\|_\rho'^2,
\|A_3\|_{\rho'} \leq \frac{27t|w|(C_\nu - 1)(2C_\nu - 1)}{\sigma^2} \|f\|_\rho'^2.
\]
Therefore, \(\mathcal{U}_t\) is Fréchet differentiable at \(w\) with derivative \(\mathcal{I}^+_{\sigma}f + (1 - t)\mathcal{I}^{-\sigma}_\rho f\) and the estimates in the statement follow immediately. This concludes the proof of Theorem 5.1.
